INTRODUCTION

This appendix presents a summary of current monitoring projects within Pacific Island Network parks, as well as selected monitoring projects deemed relevant to network parks (e.g., water quality monitoring adjacent to park waters). Table 1 summarizes this information and indicates whether monitoring is being conducted by a PACN national park or another entity, such as a federal, state, territory, or Commonwealth agency or community group. The list in this appendix is limited to monitoring projects that are designed to be long term in duration. More detailed information on each monitoring project, organized by topical area, follows the table.

Table 1. Current monitoring in parks and adjacent lands in the Pacific Island Network.

EXISTING MONITORING PROJECTS IN THE PACIFIC ISLAND NETWORK An explanation of fields used in the Existing Monitoring table

Projects are listed first by topic and then by park. Parks are listed by their four letter code. “First Year” indicates the year monitoring began and “End Year” indicates the year monitoring ended. “Status” indicates whether monitoring is currently occurring (In Work), Complete, or Planned. If a field is blank for a given record, the information is unknown.

Existing Monitoring Projects within the Pacific Island Network

TOPIC **Air Quality**

PARK : **HAVO** Project Title **CASTNET (Clean Air Status and Trends Network)**

First Year: **1999** End Year: **2004** Status **Complete** Proj Duration **5 years**

Data Type/Location Site is located at the 'Old Orchid Farm' clearing along the 'Escape Rd' in HAVO (colocated with NADP, elevation 1199 m)

Comments: **Ozone measurements ended in 2003. NOT CURRENT MONITORING--MOVE TO DATASET CATALOG.**
entry edited 6/05 by K.S.

Data Collected **Composition of total nitrogen and sulfur deposition by species; Trends in total nitrogen and sulfur deposition; Trends in wet and dry nitrogen and sulfur deposition; hourly Ozone averages; meteorological data**

Proj Purpose **CASTNET provides atmospheric data on the dry deposition component of total acid deposition, ground-level ozone and other forms of atmospheric pollution. CASTNET is considered the nation's primary source for atmospheric data to estimate dry acidic deposition and to provide data on rural ozone levels. Used in conjunction with other national monitoring networks, CASTNET can help determine the effectiveness of national emission control programs.**

Proj Usefulness **Provides data on atmospheric concentrations and deposition rates of pollutants and nutrients.**

TOPIC Air Quality			
PARK :	HAVO	Project Title	Gaseous Pollutant Monitoring Network, NPS Air Resources Division
First Year:	End Year:	Status	Proj Duration
Data Type/Location	HAVO sites: The Observatory, elevation 1123, barometric pressure,RH, Precipitation, Std. Deviation of wind direction, vector wind direction and speed, scalar wind direction, ambient temperature, sulfur dioxide; all parameters from 10/99 to 6/2004 Visitor Center, elevation 1215 m, dew point (12/1986-3/1998); RH (2/1991-7/1995 and 3/1998-present); precipitation, std dev of wind direction, solar radiation, scalar wind speed, vector wind speed and direction, ambient temperature (10/1986-present)sulfur dioxide (10/1986-present), Hydrogen sulfide (10/1986-8/1990); Ozone (11/1986-11/1995) HALE sites: Olinda Research Facility, elevation 1097 m, Ozone, dew point, RH, precipitation, scalar wind speed, ambient temperature, vector wind direction; all parameters from 6/1991 to 6/1995		
Comments:	Metadata for CASTNet, Improve and NADP data collection at the above sites are also available from this website. record edited 5/05 by K.S. CURRENT MONITORING PLAN		
Data Collected			
Proj Purpose	The NPS Air Resources Division operates a network of air quality monitoring stations (sometimes referred to as the Gaseous Pollutant Monitoring Network - GPMN) that measures primarily meteorological parameters and ozone. Sulfur dioxide is measured using continuous analyzers or with filter samplers in a subset of the network. The 1991 NPS Monitoring Strategy contains the monitoring plan that includes long-term "trends sites" and 3-5 year "baseline sites." Many stations are now operated jointly with the EPA CASTNet.

TOPIC Air Quality			
PARK :	HAVO	Project Title	Interagency Monitoring of Protected Visual Environments (IMPROVE)
First Year:	1988	End Year:	Status In work Proj Duration ongoing
Data Type/Location	The HAVO IMPROVE station is located behind the visitor center, near the rainshed; elevation 1204 m		
Comments:	At HALE IMPROVE monitoring started in 2/1991 and is ongoing. The HALE station is located at the Olinda Research facility, just outside of HALE as no suitable site within park boundaries could be identified; elevation 1158 m. record edited 5/05 by K.S. CURRENT MONITORING PLAN		
Data Collected			
Proj Purpose	The program is designed to establish current visibility and aerosol conditions in mandatory class I areas, identify chemical species and emission sources responsible for man-made visibility impairment; document long-term trends for assessing progress towards the national visibility goal, and provide regional haze monitoring representing all visibility protected federal class I areas where practical. IMPROVE monitors suspended particulate matter affecting visibility.		
Proj Usefulness	provides estimates of pollution and nutrient concentrations, deposition amounts can be calculated given that meteorological parameters are taken at the same site.

TOPIC Air Quality		
PARK : HAVO	Project Title NADP/NTN (National Atmospheric Desposition Program/ National Trends Network)	
First Year: 2000	End Year: 2005	Status Complete Proj Duration 5 years
Data Type/Location Bulk rain collection, HAVO, at the 'old orchid farm' along the 'Escape' Rd., elevation 1195 m		
Comments: A second NADP site was located at the NOAA CMDL Observatory on Mauna Loa (approx. 3 Km from HAVO boundary), elevation 3399 m, data collection from 6/1980 - 9/1993. record edited 5/05 by K.S. NOT CURRENT MONITORING.		
Data Collected Weekly integrated samples. Samples are analyzed for hydrogen (acidity as pH), sulfate, nitrate, ammonium, chloride, and base cations (such as calcium, magnesium, potassium and sodium).		
Proj Purpose The purpose of the network is to collect data on the chemistry of precipitation for monitoring of geographical and temporal long-term trends.		
Proj Usefulness Provides data on nutrient and pollutant input, acid rain deposition. Allows evaluation of volcanic influence on precipitation chemistry.

TOPIC Air Quality		
PARK : NPSA	Project Title NOAA CMDL Baseline Observatories.	
First Year: 1975	End Year:	Status In work Proj Duration
Data Type/Location Cape Matatula, Tutuila;77.00 masl; Latitude: 14.23 S; Longitude: 170.56 W Mauna Loa, Hawaii; 3397 masl; Latitude: 19.54 N; Longitude: 155.58 W		
Comments: The Mauna Loa Observatory is located just outside HAVO; the same parameters as in Am.Samoa are measured; operations started in 1956; in addition a number of REsearch groups collect data. NOAA CMDL has also been collecting meteorological data at these sites since 1976. See record# 233		
Data Collected carbon dioxide, carbon monoxide, methane, nitrous oxide, surface and stratospheric ozone, halogenated compounds including CFC replacements, hydrocarbons, sulfur gases, aerosols, and solar and infrared radiation		
Proj Purpose CMDL conducts sustained observations and research related to source and sink strengths, trends and global distributions of atmospheric constituents that are capable of forcing change in the climate of Earth through modification of the atmospheric radiative environment, those that may cause depletion of the global ozone layer, and those that affect baseline air quality.		
Proj Usefulness extended time series of atmospheric nutrients and pollutants (aerosols and gases)and solar radiation.

TOPIC Air Quality	
PARK : PUHO	Project Title Hawaii Air Quality Data
First Year: 1997 End Year:	Status In work Proj Duration
Data Type/Location	This station is located on the grounds of the Konawaena High School at 81-1043 Konawaena School Road in Kealahou, Hawaii. This special purpose monitoring station was established in April 1997 to monitor vog in the Kona area. The pollutant sampled at this site is SO ₂ . The coordinates are 19°30'27.83302" N latitude and 155°55'03.67861" W longitude.
Comments:	Several other stations in the state of Hawaii. Parameters measured at the various stations include SO ₂ , H ₂ S, pm _{2.5} and pm ₁₀ . Another site close to a National Park is the Pearl City station in close proximity to USAR at which pm ₁₀ and pm _{2.5} have been measured since 1971.
Data Collected	SO ₂ since 1997.
Proj Purpose	The primary purpose of the statewide monitoring network is to measure ambient air concentrations of pollutants and ensure that state and federal air quality standards are met.
Proj Usefulness

TOPIC Air Quality	
PARK : WAPA	Project Title NOAA CMDL Carbon Cycle Greenhouse Gases
First Year: 1979 End Year: 2002 Status Complete	Proj Duration
Data Type/Location	Guam Site is at Lat: 13.43 Long: 144.78 Elevation: 6m
Comments:	NOAA/CMDL flask data from Guam show an increase in the annual mixing ratio from 340.05 parts per million (ppm) in 1980 to 373.26 ppm in 2002. (Tans, Pieter P. and T.J. Conway, 2005. Monthly Atmospheric CO ₂ Mixing Ratios from the NOAA CMDL Carbon Cycle Cooperative Global Air Sampling Network, 1968-2002. In Trends: A Compendium of Data on Global Change. Carbon Dioxide Information Analysis Center, Oak Ridge National Laboratory, U.S. Department of Energy, Oak Ridge, Tenn., U.S.A.)
Data Collected	Air samples are collected approximately weekly from a globally distributed network of sites. Samples are analyzed in Boulder by CCGG for CO ₂ , CH ₄ , CO, H ₂ , N ₂ O, and SF ₆ ; and by INSTAAR for the stable isotopes of CO ₂ and CH ₄ .
Proj Purpose	The NOAA CMDL Carbon Cycle Greenhouse Gases group makes ongoing discrete measurements from land and sea surface sites and aircraft, and continuous measurements from baseline observatories and tall towers. These measurements document the spatial and temporal distributions of carbon-cycle gases and provide essential constraints to our understanding of the global carbon cycle.

TOPIC		Aquatic Biology (fresh)	
PARK :		WAPA	
Project Title		Freshwater Monitoring: native stream fauna	
First Year:	End Year:	Status	Planned
Proj Duration			
Data Type/Location			
Comments: Not occurring in the park to my present knowledge (rgd); however, could be relevant to park streams as these might be some of only monitoring data that have/will be collected for freshwater streams in Guam.			
Data Collected			
Proj Purpose The freshwater monitoring project of DAWR is designed to gather long-term, reliable data for watershed management. Species composition, organism density, and habitat characteristics were collected in the rivers identified as experimental and controls were chosen in FY97, using the methods described in the annual report of FY97. The experimental rivers, located above Fena Reservoir included: Almagosa; Maulap; and Sadog. These watersheds were selected because they represent a range of watershed characteristics that may help to determine the impacts of the present and proposed land uses. The control rivers include: Maagas; Manenggon; Pago; and Ylig. [The study was originally set up to look at the effects of the dam on the fauna—especially upstream migration, thus rivers below the dam were designated as controls, and those above the lake as experimetnal. The project has a second aim, to heighten public interest in native species found in freshwater ecosystems and to develop a recreational fishery based on native species in Guam's rivers. Knowledge of and interest in freshwater species is limited on Guam. To increase awareness of these important organisms and their habitats, educational materials, such as a field guide and posters, need to be developed. Additionally, some native species, such as the flagtail Kuhlia rupestris, are ideal candidates for a recreational fishery.

TOPIC Climate	
PARK : HALE	Project Title HaleNet (Haleakala Climate Network)
First Year: 1988 End Year:	Status In work Proj Duration ongoing
Data Type/Location HaleNet consists of two transects of climate stations along the leeward and windward slopes of Haleakala volcano, Maui Island, Hawai'i. All but two stations in the network are within Haleakala National Park.	
Comments:	
Data Collected parameters as listed below, HaleNet I (6 leeward) stations were established between 1988 and 2000 and are all currently active. Halenet II (5 windward) stations were established in 1992 (1 station in 200); 4 stations are still active. TOPIC Climate		
PARK : NPSA	Project Title Hydrologic data collection in American Samoa. USGS	
First Year: 1985 End Year:	Status In work	Proj Duration
Data Type/Location Sites located on Tutuila. Network of 5 rain gages, 6 surface-water gages, and 52 wells (ground-water sites) is maintained. Data are collected using standard USGS methods		
Comments: Next to check if NPSA has a copy of the 2 publications associated with this project. NPSA does not have a copy of U.S. Geological Survey nor B. R. Hill Water resources reports.		
Data Collected Rainfall, stream flow and ground-water levels.		
Proj Purpose Assessing water resources to provide provide scientific information for the management of water resources.		
Proj Usefulness Data are useful to Federal, State, and local planners for: (1) assessing water availability, flooding hazards, drought conditions, and ground-water/surface-water interactions, (2) estimating future conditions, (3)managing water resources.		
Oranizations associated with this Project:		Theme Keywords associated with Project:

Proj Purpose The University of Hawaii Sea Level Center (UHSLC) is a research facility of the University of Hawaii/NOAA Joint Institute for Marine and Atmospheric Research (JIMAR) within the School of Ocean and Earth Science and Technology (SOEST). The UHSLC originated as the TOGA Sea Level Center under the leadership of Professor Klaus Wyrski of the University of Hawaii, Department of Oceanography. The center was a natural extension of Professor Wyrski's pioneering research on the El Nino Southern Oscillation in the Pacific Ocean. Under the current direction of Dr. Mark Merrifield, the mission of the UHSLC is to collect, process, distribute, and analyze in-situ tide gauge data from around the world in support of climate research. Primary support for the UHSLC comes from NOAA's Office of Global Programs (OGP). Funding is also provided by NASA under the JASON program for the development of In Situ Tide Gauge/GPS Stations for Monitoring the Temporal Drift of Satellite Altimeters. The UHSLC also hosts the Joint Archive for Sea Level (JASL), a collaborative effort with the National Oceanographic Data Center (NODC).

TOPIC **coral reef**

PARK : **ALKA** Project Title **Hawaii Coral Reef Assessment and Monitoring Program (CRAMP)**

First Year: **1997** End Year: Status **In work** Proj Duration

Data Type/Location **CRAMP has several sites located in the ALKA corridor, including coral reef monitoring sites at Kawaihae, Nenu Pt, Laaloa, and Kaapuna.**
Two types of protocol are utilized by CRAMP: Monitoring Protocol and the Rapid Assessment Technique (RAT).
The RAT is simply an abbreviated version of the Monitoring Protocol and is a rapid method for describing spatial relationships. The RAT lacks the statistical power of the Monitoring Protocol to detect change in the benthos, but is a more cost-effective method for answering certain questions on the status of coral reefs.
RAMP has developed standardized coral reef assessment and monitoring methods that provide scientifically rigorous biological data for corals and fishes but not other ecosystem components, including other invertebrates and algae. Transects are at three and nine meter (10 and 30 feet) depths, which does not encompass extensive areas of reef development below these depths.
Detailed methods can be found here: http://cramp.wcc.hawaii.edu/Overview/3._Methods/3._Site_Survey_Protocol/

Comments: **created by Raychelle 27 June 2005; needs more information regarding data capture and keyword place names**

Data Collected

Proj Purpose **CRAMP is a research program designed to identify the controlling factors, both natural and anthropogenic, contributing to the stability, decline, or recovery of Hawaiian reefs. CRAMP has developed a standard coral reef assessment and monitoring methodology in achieving its goals. CRAMP is an integrated state-wide program with a common data base and rapid information dissemination system that provides the means for managers and researchers to detect and respond appropriately to environmental threats on Hawaiian reefs.**
The Hawaii Coral Reef Assessment and Monitoring Program (CRAMP) was developed during 1997-98 by leading coral reef researchers, managers and educators in Hawaii. The CRAMP experimental design enables us to detect changes on coral reefs and increase our understanding of the controlling factors (natural and anthropogenic) influencing reef stability, decline and recovery. The design was further refined during the international "Hawaii Coral Reef Monitoring Workshop" organized by the Division of Aquatic Resources (DAR) in conjunction with the East-West Center and held in Honolulu during June 9-12, 1998 (Maragos and Grober-Dunsmore, 1999).

TOPIC coral reef	
PARK : ALKA	Project Title Reef Check
First Year:	End Year: Status In work Proj Duration
Data Type/Location	<p>The original Reef Check methods were designed to be carried out once per year at each site. This level of temporal replication is typically sufficient to characterize changes in reef corals and other sessile invertebrates. If there is sufficient manpower, this may be increased to twice per year to get a seasonal update.</p> <p>For mobile invertebrates and reef fish, however, this frequency of replication is generally considered too low for a meaningful stock assessment at one site (but when repeated at many sites, the snapshot becomes very meaningful). It is important to recognize that the sample size used in one Reef Check survey is robust with respect to the parameters measured.</p> <p>What allows the survey to be carried out quickly is that there are relatively few parameters measured and no temporal replicates.</p> <p>To use Reef Check methods for long-term monitoring of fish and mobile invertebrates, additional temporal replicates should be made of the fish and invertebrate belt transects. A pilot study could be carried out to determine the variability of fish and invertebrate populations at a given location. A suggested rule of thumb would be to carry out three replicate surveys at each site (i.e. three repeat surveys of one transect deployment), and then to resurvey each site at quarterly intervals. If the taxonomic requirements are not increased too much, this higher intensity survey could still be accomplished by recreational divers.</p> <p>The core methods include four spatial replicates along the transect line. Given the low taxonomic specificity in the methods (typically family level), these replicates are sufficient to capture variability within one site, and the overall 100 m length of the sample is robust. However, it is desirable to measure variability at several sites within "the area of interest." Thus for long-term monitoring within say, a 1 km wide bay, a set of three to five sites might be used.</p> <p>The core methods include two transects with the deepest located at a maximum allowable depth of 12 m. The Reef Check program does not accept data obtained from deeper areas for two reasons: safety considerations and the fact that reefs do not extend below this depth in many parts of the world making regional and global comparisons difficult.</p> <p>However, in areas where it is important to record information at greater depths, a third or forth transect could of course be surveyed and the information used locally. Although these data will not be included in the annual Reef Check report, they could be submitted directly to ReefBase.</p>
Comments:	<p>While there are limitations on the scope and quality of data collected it can be argued that for many reefs where no information exists, some information is better than none.</p> <p>No data is collected within any of the NPS parks, however, there are teams located on Guam, Saipan, American Samoa, the Island of Hawaii, and Maui and therefore this record pertains to ALKA, PUHE, PUHO, KAHO, HAVO, HALE, KALA, AMME, WAPA and NPSA</p>
Data Collected	
Proj Purpose	Reef Check is an international program that works with communities, governments and businesses to scientifically monitor, restore and maintain coral reef health. Reef Check objectives are to: educate the public about the coral reef crisis; to create a global network of volunteer teams trained in Reef Check's scientific methods who regularly monitor and report on reef health; to facilitate collaboration that produces ecologically sound and economically sustainable solutions; and to stimulate local community action to protect remaining pristine reefs and rehabilitate damaged reefs worldwide.

TOPIC	coral reef		
PARK :	AMME	Project Title	CNMI Nearshore reef monitoring program - CNMI Inter-Agency Marine Monitoring Team (MMT)
First Year:	2000	End Year:	Status In work Proj Duration (since June 2000)
Data Type/Location	<p>9 sites are being monitored, including one offshore from the park, Managaha Reef. These nine sites were selected based on their potential disturbances and sources of stress for coral reefs.</p> <p>For each site 3 50m transects laid parallel to shoreline and marked w/sediment trap holder and re-bar driven into reef. Once finished each site marked w/gps reading and stored.</p> <p>Benthic cover evaluated using photo point quadrat method (modified from Cheenis Pacific Company 1992). For each site data collected for each of three 50m transects. Underwater camera was used to take still photographs of .5m quadrats placed at even numbers along the transect line. For each photo the bottom right corner of the quadrat was aligned with the corresponding transect line distance. If major topographic relief existed (>10 ft.) the frame was skipped. Slides were developed and analyzed at the DEQ office by noting the life form under each of the 16 intersecting points for each quadrat. Means, standard deviations, and standard errors were calculated based on the three 50-m replicates, with approximately n=300 individual points per 50-m replicate. The benthic categories chosen for analysis were corals (to generic level), turf algae (less than 2cm), macroalgae (greater than 2 cm, genus level if abundant), coralline algae, branching coralline algae, all other inverts (grouped together due to lack of abundances), and sand/bare substrate.</p> <p>CORAL COMMUNITIES:</p> <p>Coral communities were further examined using the point-quarter method described by Randall et al., (1988). A dive knife was haphazardly tossed 16 times along the three transects. For each toss the distance to the nearest living coral colony was noted for each of four quadrants, as well as the diameter and taxonomic name. This yielded data regarding population densities, species coverage, relative abundances, size distributions, and total coral coverage for any given site.</p> <p>FISH SURVEYS:</p> <p>Fish surveys were completed along each of the three 50-m transect lines. In each case, transect lines were set and all divers waited on the boat while a single observer swam along the transect lines recording data. Counts of all fishes were made within 5 meters of each side of the transect line. Fishes were identified to the family level and analyzed as such.</p> <p>MACROINVERTEBRATES:</p> <p>All macroinvertebrates were counted within 2 meters of each side of the transect line. This data was presented as abundances per (100-m^2) of reef on each of three transects. The macroinvertebrates were identified to the generic level when applicable, or grouped by life form, depending on abundances.</p> <p>At each site a list of all fishes and scleractinian corals observed was created. Coral nomenclature was based upon Veron (2000), and fish nomenclature was based upon Myers (1999).</p> <p>SEDIMENTATION AND WATER QUALITY PARAMETERS:</p> <p>Sedimentation rate data were only collected from selected sties, where sediment loads were potentially a concern. In each case, two sediment traps were placed at the beginning of each of three 50-m transect lines, for a total of six traps per site. Traps were deployed for 3-4 weeks before collection and subsequent analysis. Sediment samples were dried and weighed at the DEQ laboratory for total sediment content. Sedimentation rate data collection was dependent on local weather conditions and site accessibility. Water quality samples were taken from sites whenever the opportunity existed and analyzed for pH, salinity, temperature, turbidity, dissolved oxygen, and total phosphates.</p>		
Comments:	Not conducted inside any park boundaries. This record was included because coral reefs, fishes in marine environment are important to the park.		
Data Collected	benthic cover, coral communities, fish abundance, macroinvertebrate abundance, sedimentation rates & other water quality parameters.		
Proj Purpose	long-term coral reef monitoring. Data included in this report concerns benthic coverage, coral communities, fish and macroinvertebrate abundances, coral and fish biodiversity, sedimentation rates (where applicable), and water quality analysis. These criteria were selected because they are most likely to reflect changes in the reef communities of the CNMI.		
Proj Usefulness	Serves as a baseline for future studies of most sites; some data exist for several sites surveyed between 1983 and 1997

First Year:	End Year: Status In work Proj Duration				
Data Type/Location Site #NL12 associated with AMME					
Comments: adjacent to the park; need more info from Houk/Leslie?					
Data Collected lagoon benthic communities (?) such as seagrass					
Proj Purpose The Saipan Lagoon Monitoring Program is an ongoing effort between the DEQ and CRM. Our goal is to document the present status of the Saipan Lagoon using qualitative and quantitative measures. Our final goal is to produce a complete habitat map of the lagoon that includes data regarding the present status of each region. This information will be used to help DEQ, CRM, decision makers, other environmental managers, and the public to understand where upland pollution concerns are greatest. Also, these data can be used to assess the success or failure of future management strategies and infrastructure that will be used.

PARK : KAHO	Project Title Reef Environmental Education Foundation (REEF)
First Year:	End Year: Status In work Proj Duration
Data Type/Location	
Comments: Entry created by raychelle 27 June 05; DO NOT DELETE as this entry also related to KALA - two sites located at: site 4304, the North side Molokai the North side Molokai (Ilio Pt-Halava; and site 43040001 North Shore Cliffs (Wailau Valley). And PUHO, there is a site located at PUHO. NPSA: First REEF surveys were Nov 04 and official launch end of 05.	
Data Collected	
Proj Purpose REEF was founded in 1990, out of growing concern about the health of the marine environment, and the desire to provide the SCUBA diving community a way to contribute to the understanding and protection of marine populations. REEF achieves this goal primarily through its volunteer fish monitoring program, the REEF Fish Survey Project. Participants in the Project not only learn about the environment they are diving in, but they also produce valuable information. Scientists, marine park staff, and the general public use the data that are collected by REEF volunteers.

PARK : KALA	Project Title Coral reef monitoring program
First Year: 2005 End Year:	Status Planned Proj Duration
Data Type/Location	no data collected to date
Comments: would be monitoring in the park.	
Data Collected	no data collected to date, in the planning stages
Proj Purpose	A coral reef monitoring program is being initiated within KALA in 2005 that will focus on coral abundance (percent cover), density of other subtidal macroinvertebrates, algal abundance (percent cover), and fish assemblage characteristics (species richness, abundance, biomass, and diversity). Sampling protocols are currently being developed in conjunction with other PACN parks and will most likely resemble the statewide CRAMP protocol (Jokiel et al. 2004). Utilizing similar protocols to collect standardized metrics (e.g., percent cover) will enable comparisons at a larger spatial scale.

PARK :	WAPA	Project Title	Assessing coral recruitment as a function of local sedimentation rates
First Year:	2003	End Year:	Status In work Proj Duration
Data Type/Location	An array of 50 sediment traps are being monitored w/ water quality stations to monitor temp & light. Coral settling plates will be set out at 30' and 60' at 3 paired locations in the 2 marine units. Total of 96 plates will be monitored for coral recruits.		
Comments:	Metadata contact: Dwayne Minton, WAPA; Gordon Dicus, HAVO, is developing databases for this project. This is a recent project, but Dwayne Minton, Ecologist at WAPA see this as an important long-term monitoring project for WAPA.		
Data Collected	Presently the following are being collected every three weeks in sediment traps, (started in June-July) 1) amount of sediment in (g) 2) Percent of organics, percent of terrestrial material 3) grain size determination The recruitment sampling apparatus consists of a 4-limbed "tree" with each branch holding one pair of PVC recruitment plates (15cm x 15 cm) in both horizontal and vertical positions and plates will be collected every six weeks. Plates are microscopically examined for number of recruits, taxonomy & spatial location on the plate. During peak coral spawning times (summer) plates will be collected & analyzed more frequently.		
Proj Purpose	Original Project Purposes: 1) Assess spatial and temporal patterns of coral recruitment at WAPA 2) Assess the relationship between sedimentation deposition and coral recruitment rate 3) Provide baseline data on the identity of coral recruits AGAIN, see notes, as WAPA ecologist sees this project as being a long-term monitoring project for WAPA, with two compenents, the data on sedimentation data collection and the coral recruitment		
Proj Usefulness	In conjunction with ongoing sedimentation and water quality projects, information from this study will be used to develop best management practices for upland terrestrial watersheds at WAPA with respect to erosion mitigation. In addition, this information will be provided to the Territory of Guam and to the University of Guam for consideration in future academic or natural resource management projects.

PARK : **HALE** Project Title **Monitoring of forest birds**

First Year: **1980** End Year: Status Proj Duration

Data Type/Location **Surveys occur along transects that were set in 1980 in the rainforest areas of Haleakala. The annual surveys focused on "good forest" occuring in upper elevations. Complete transects are surveyed during the state coordinated surveys (which is every 5 years or so) or when there is other biological need. The surveys occur once a year, beginning the 3rd week of April. We try to complete surveying of all transects by the end of May.**

Comments:

Data Collected **VCP began in 1980. Next survey was in 1992. Annual surveys started in 1996 in selected areas.**

Proj Purpose **To monitor forest birds in the upper portion of Kipahulu Valley using Variable Circular Plot method**

Proj Usefulness **Work with State of Hawaii**

TOPIC	Fauna											
PARK :	HALE	Project Title	Nene Monitoring									
First Year:	1962	End Year:	Status In work Proj Duration									
Data Type/Location	Sightings are incidental or occur during annual surveys. These include mortalities. Banding occurs throughout the year. Unbanded nene and young nene are targetted. They are so hard to capture, it's pretty much just "get what we can, when we can."											
Comments:	Monitoring using current methods began in 1988. Monitoring using other methods began in 1962.											
Data Collected	Banding: age, weight, skull length, leg length, wing length, number in group, mate, blood sample, fecal sample, and capture method. Sightings: sex, abdominal profile, cloud cover, fog, wind, precipitation, and temperature. Nesting data includes aggression by male and/or female, number of eggs, general location, and nest status (abandoned, chicks, hatching, etc.)											
Proj Purpose	To monitoring populations of nene through banding, sightings, and nesting locations.											
Proj Usefulness	Work with the State											
Oranizations associated with this Project:		Theme Keywords associated with Project:

TOPIC	Fauna											
PARK :	HALE	Project Title	Petrel Monitoring									
First Year:	1966	End Year:	Status In work Proj Duration									
Data Type/Location	A number of burrows (Porject burrows) are randomly selected and checked monthly. Others are checked quarterly. (When) Traps are placed outside of burrows to capture individuals who are then banded and released. Banding of adults is the 3rd week of July when adults are incubating eggs. Banding of fledglings is 1st week of October, just before young leaves the colony. To determine which burrows to trap, burrows must indicate signs of activity and be relatively easy to either set traps, or block burrow entrances. We block entrances only in July with hopes of capturing an adult that is waiting at the burrow entrance.											
Comments:												
Data Collected	Burrows are checked for sign of entry and sign if fledgling. Banding data includes: age, sex, area, capture method, blood sample, amount of down, diet sample, weight, skull length, tarsus length, wing length, culmen measurements, and whether it is alive. If a bird is sighted or dead, the location is noted.											
Proj Purpose	The Hawaiian Dark Rumped Petrel is an endangered seabird whoe primary nesting habitat is now restricted to upper elevations on Haleakala. These are being monitored during the months they are present to ascertain activity and fledgling success.											
Proj Usefulness

PARK : **HAVO** Project Title **Hawaii Forest Bird Surveys**

First Year: **1977** End Year: **1994** Status **In work** Proj Duration

Data Type/Location

Comments: **NOT CURRENT MONITORING.**

Data Collected

Proj Purpose **Forest bird surveys in HAVO ceased in the mid 1990s. This monitoring program provided critical information on bird distribution and densities along moisture and elevational gradients. HAVO is uniquely situated along a moisture gradient (<1000 - > 4000 cm annual rainfall) ranging from wet to mesic to dry forests. Monitoring bird populations along this gradient provides insight into ecological dynamics and population responses not available elsewhere. The park provided the only recent source of forest bird data along an elevational gradient (2000 – 7000 ft.; East Rift Zone to Mauna Loa Strip transects). Additionally, a long term monitoring program is essential to determining population fluctuations and changes, and species' range contractions/expansion**

PARK : NPSA	Project Title Bat Monitoring
First Year: 1997	End Year: Status In work Proj Duration
Data Type/Location	Monitor Tutuila by boat and by trail/roads, on a quarterly basis, all known Pteropus tonganus colonial (white naped fruit bat) roosts. Monthly point counts of Pteropus samoensis (Samoan fruit bat) are conducted at 7 sites on Tutuila, one of which is within the park at Amalau Valley. Current methodology involving eight 10-minute counts with 5 minute intervals has been applied since 1997. Counts are conducted at roosts, either through estimates of colony size from a remote location or through counts of bats emerging from roosts at dusk. Manua islands are surveyed on an annual basis- check craters, roadsides, etc. for both species.
Comments:	
Data Collected	Point counts- generate indices of abundance used both to track temporal changes and to compare patterns in numbers among sites.
Proj Purpose	To monitor frugivorous bats in NPSA.
Proj Usefulness

TOPIC Fish	
PARK : WAPA	Project Title Inshore fisheries surveys
First Year: 1982 End Year:	Status In work Proj Duration
Data Type/Location	<p>A two-part roving creel survey, effort (or participation) and catch, is performed for both day and night (begun in 1985) to provide sufficient data to allow for 90% confidence limits for the inshore analysis. During an effort survey, a surveyor records all active fishing participation (time of day, location, number of people,</p> <p>number of gear units, fishing methods, reef zone fished, weather conditions, and surf conditions). Counts are made of fishermen and gear and are used to estimate effort in terms of person-hours (p-hr) and gear-hours (g-hr). The catch survey is of the roving fisherman-intercept type and requires as many interviews for as many fishing methods as possible. The survey variables collected include fishing method, number of fishermen, bait type, number of gear, mesh size, interview time, trip length, species caught, numbers of catch species, and individual weights and lengths. Catch data is used to estimate overall landings (kg), CPUE, and species composition. (Hensley and Sherwood 1993) On any given survey (inshore catch or fishermen interview) day, one survey area is randomly selected from either Gun Beach to Adelupe (region I: locations 1-11), Adelupe to Agat (region II: locations 12-34), or Pago to Merizo (region III: locations 41-71) and inshore data collection is restricted within the selected region.</p>
Comments:	<p>Inshore fisheries encompass the coral or nearshore shallow adjacent waters which consists mostly of fringe reefs. "Fishing activity has been monitored since the early 1960's when much of the early information was taken by DAWR conservation officers (law enforcement) personnel). Monitoring changed over the years, as did fish identification. The early 1960's catch was identified by the Chamoru name of the fish. Problems with catch composition arose because one name could mean any wrasse species, parrotfish would be identified by color (blue, brown, white, and green), and rabbitfish would be identified by at least five names that described the fish by size. As taxonomic skill increased, the catch was reported in increasing detail." (Hensley and Sherwood 1993)</p> <p>Data are collected in the park. See type and location of sampling above.</p>
Data Collected	To identify trends in fishing participation, effort, and catch, the Division of Aquatics and Wildlife Resources (DAWR) has been monitoring day and night coastal fishing activities since FY85. Over this period of time, survey and analysis methodologies have changed in response to fluctuations in budget and staff. In the last several years, however, field survey techniques have been expanded and refined, while estimates of Guam's recreational and subsistence fishing activities have come to be based on more reliable data analysis techniques.
Proj Purpose	<p>Effective management of Guam's inshore fishery resources requires accumulating data on the types of fishing methods used, fishing pressure, and annual catch.</p> <p>Objectives are to:</p> <p>1) To maintain the collection of baseline catch and effort data and identify harvest trends in</p> <p>Guam's inshore fishery.</p> <p>2) To gather limited biological (opportunistic) data on fishing methods, reef fish species, and habitat for management purposes.</p>
Proj Usefulness

TOPIC **Fish**

PARK : **WAPA** Project Title **Stock Assessment Surveys of Marine Preserves and Control Sites**

First Year: **1999** End Year: Status **In work** Proj Duration

Data Type/Location **Visual transects and interval counts are used to assess fish species. Video transects were used in fy99. Benthic monitoring to begin in 2004**

Comments:

Data Collected **Conducting fish counts and timed-swim counts on 36 permanent transects located in reef flat and lagoon habitats in Achang Reef Flat Marine Preserve, Piti Bomb Holes Marine Preserve, Asan Bay, Pago Bay, and Cocos Lagoon, and Conducting fish counts, timed-swim counts, and video transects on 32 permanent transects located at the 20', 30', 40', and 50' depth contours of the fore reef slopes in Achang Reef Flat Marine Preserve, Piti Bomb Holes Marine Preserve, Asan Bay, and the backside of Cocos Lagoon**
Annually, to establish a baseline and subsequently compare data consisting of reef fish density estimates, species composition, size-class distribution, and substrate composition.

Proj Purpose **To evaluate the effect on sport fish populations caused by the creation of marine preserves by incorporating the following measures:**
1) Conduct video and interval transect surveys within MPAs and control sites.
2) Establish baseline stock assessment surveys to measure the effectiveness of MPAs compared to control sites.

Proj Usefulness **Provides assessment of fisheries impact/effect.**

TOPIC	Geology				
PARK :	ALKA	Project Title	Pacific Tsunami Warning Center		
First Year:	1949	End Year:	Status	In work	Proj Duration
Data Type/Location	A summary outline of the operational procedures used by PTWC for the issuance of the above bulletins as related to earthquake magnitude on the Richter scale (Ms) is as follows: EARTHQUAKE MAGNITUDE *PTWC ACTION A. Mwp greater than Alarm threshold. but less than 6.5 *Provide data and information to USGS/NEIC and/or other participating observatories B. Mwp equal to or greater than 6.5. but less than or equal to 7.5 (7.0 in the Aleutian Islands) *Issue TSUNAMI INFORMATION BULLETIN, with the evaluation that a Pacific wide tsunami was not generated. C. For events in ATWC's area of responsibility exceeding ATWC Warning threshold, but less than PTWC Warning/Watch threshold. *(1) Monitor pertinent tide stations. *(2) Issue TSUNAMI INFORMATION BULLETIN with initiation of Investigation. *(3) Based on tide station response: *(a) Issue final TSUNAMI INFORMATION BULLETIN *(b) Issue TSUNAMI WARNING. *(c) Continue investigation by issuing additional TSUNAMI INFORMATION BULLETIN. D. Mwp greater than 7.5 (or 7.0 for Alaska) *(1) Issue REGIONAL TSUNAMI WARNING/WATCH BULLETIN. Issue E/Q ADVISORY or WATCH for State of Hawaii (see note below). *(2) Monitor pertinent tide stations. *(3) Based on tide station response: *(a) Issue CANCELLATION of REGIONAL TSUNAMI WARNING/WATCH BULLETIN. *(b) Issue PACIFIC-WIDE TSUNAMI WARNING BULLETIN. *(c) Continue investigation by issuing additional REGIONAL TSUNAMI WARNING/WATCH BULLETINS until the tsunami warning/watch is canceled. (4) On issuance of a PACIFIC-WIDE TSUNAMI WARNING, continue investigation by issuing TSUNAMI WARNING BULLETINS until the tsunami warning/watch is canceled.				
Comments:	This pertains to all eleven parks in the PACN: ALKA, AMME, WAPA, NPSA, USAR, PUHE, PUHO, KAHO, KALA, HAVO & HALE.				
Data Collected	The PTWC issues four basic types of information, as summarized below: A. Pacific-wide Tsunami Warning Bulletin - A message issued to all participants on a Pacific-wide basis after confirmation has been received that a tsunami capable of causing destruction beyond the local area has been generated and poses a threat to the coastal population for the entire Pacific Basin. Each hour updated information will be sent until the Pacific-wide Tsunami Warning is canceled. B. Regional Tsunami Warning/Watch Bulletin - A message issued initially using only seismic information to alert all participants of the probability of a tsunami and advise that a tsunami investigation is underway. The area placed in Tsunami Warning status will encompass a 3-hour tsunami travel-time relative to the time of message issuance . Those areas within a 3 to 6-hour tsunami travel-time will be placed in a Watch status. A Tsunami Warning/Watch will be followed hourly by additional bulletins until it is either upgraded to a Pacific-wide Tsunami Warning or is canceled. C. Tsunami Information Bulletin - A message issued to advise participants of the occurrence of a major earthquake in the Pacific or near-Pacific area, with the evaluation that either (a) A Pacific-wide tsunami was not generated based on earthquake and historical tsunami data. This will be the only bulletin issued. No Pacific-wide tsunami warning is in effect; or (b) An investigation is underway to determine if a Pacific-wide tsunami has been generated. Additional bulletins will be issued hourly or sooner as information becomes available. No Pacific-wide tsunami warning is in effect; or (c) No destructive Pacific-wide tsunami threat exists. However, some areas may experience small sea level changes. This will be the final bulletin issued unless additional information becomes available. No Pacific-wide tsunami warning is in effect.				

If the event occurs in ATWC's area of responsibility and exceeds the ATWC Regional Warning threshold but is less than the PTWC Warning/Watch threshold an investigation will be initiated by PTWC and additional Tsunami Information Bulletins will be issued until the investigation is concluded.

D. Tsunami Communication Test - Test messages are issued by PTWC at unannounced times on a monthly basis to determine writer-to-reader delays in disseminating tsunami information, to test the operation of the warning system by the evaluation of two-way communications with interactive personnel response, and to keep communication operating personnel familiar with the procedures for handling message traffic pertaining to the TWS .

Proj Purpose The operational objective of the TWS in the Pacific is to detect and locate major earthquakes in the Pacific region, to determine whether they have generated tsunamis, and to provide timely and effective tsunami information and warnings to the population of the Pacific to minimize the hazards of tsunamis, especially to human life and welfare. To achieve this objective, the TWS continuously monitors the seismic activity and ocean surface level of the Pacific Basin.

TOPIC **Geology**

PARK : **AMME** **Project Title** National Volcanic Ash Advisory Center (VAAC)

First Year: 1980 **End Year:** 2004 **Status** In work **Proj Duration** ongoing

Data Type/Location Global satellite monitoring

Comments: No PI contact - ongoing computer-based monitoring program at NOAA, see website for more info. Applies to ALL parks.

Data Collected **Products:**

Volcanic Ash Advisories (VAA)

The current VAA page is updated with each new advisory. When we can clearly see a plume of ash in satellite Imagery, it is graphically depicted, and sent to our message page.

Sample - From Soufriere Hills

A Graphic representation of the ash plume as seen on satellite imagery is attached to the message when available, but only on the Internet. (Graphic Sample).

After 15 days on the current page, VAA Messages are Archived by year. The current year archive is updated daily shortly after midnight UTC. Past Archives: 1999 ; 2000 ; 2001

Volcanic Ash Forecast Transport and Dispersion (VAFTAD) Model

This is a graphical forecast tool produced by NCEP which has been recently added to our web site. These operational VAFTADs are maintained on our site for approximately 15 days.

The VAFTAD Sample is from Soufriere Hills. It is part of a Paper presented at the Third Caribbean/South American Regional Air Navigation Meeting (abbreviated CAR/SAM/RAN/3) entitled Operations Of The Washington Volcanic Ash Advisory Center.

VAFTADs are also placed on the Internet by The Air Resources Lab (ARL) Here's a link to the current VAFTAD on their site (if one is current). They also run hypothetical VAFTADs.

Proj Purpose The National Center for Environmental Prediction (NCEP) of the National Weather Service (NWS) and the Satellite Analysis Branch (SAB) of the National Environmental Satellite, Data and Information Service (NESDIS), are jointly responsible for the activities of the Washington VAAC located in Camp Springs, Maryland. The Satellite Analysis Branch is responsible for monitoring all available satellite imagery for volcanic ash plumes and issuing Volcanic Ash Advisories (VAA). The National Center for Environmental Prediction is responsible for issuing Volcanic Ash Forecast Transport and Dispersion (VAFTAD) Models. Operation of the Washington Volcano Ash Advisory Center (VAAC) officially began November 1, 1997 although SAB has been monitoring volcanoes as far back as 1980.

Proj Usefulness Provides advance warning of volcanic ash eruptions, which are hazardous to agriculture, aviation, and some settlements.

PARK : **HAVO** Project Title **Gas/ Geochem Monitoring of Kilauea Volcano**

First Year: **1979** End Year: Status Proj Duration **on-going**

Data Type/Location

Comments: **CURRENT MONITORING PLAN**

Data Collected

Proj Purpose **At Kilauea (HAVO), sulfur dioxide (SO2) emission-rate measurements have been collected nearly weekly since 1979 using a correlation spectrometer (COSPEC). These measurements constitute an unusually complete data set. Chemical analysis of gas samples taken from volcanic vents at the summit and rift zones of Kilauea and Mauna Loa has helped to improve models of how these volcanoes release volatiles. Carbon/sulfur ratios are measured about weekly at the summit of Kilauea. A network of continuously monitoring stations using chemical sensors for individual gas species is under development**

Proj Usefulness **Good way of monitoring flux of erupted lava over time, also useful in comparison to other volcanoes worldwide.**

TOPIC Geology			
PARK :	HAVO	Project Title	Ground Deformation Monitoring
First Year:	End Year:	Status	Proj Duration on-going
Data Type/Location			
Comments: CURRENT MONITORING PLAN			
Data Collected			
Proj Purpose	HVO collects accurate and timely ground-deformation data to monitor Hawaiian volcanoes. Data from tiltmeters are sampled every 10 minutes and provide the only real-time deformation monitor (HAVO). Continuous Global Positioning Survey (GPS) data are sampled every 30 seconds, but they currently download the data only once a day and calculate one-day average positions (HAVO). HVO conducts periodic (one or more times per year) leveling, GPS, EDM (electronic distance measurement) and dry tilt surveys (HAVO, HALE, PUHO, PUHE, KAHO). Each survey or data point can be compared with previously sampled data to determine accumulated ground deformation and to calculate strain rates or velocities. HVO is currently upgrading its deformation-monitoring program to emphasize real-time monitoring of Mauna Loa and Kilauea. This upgrade includes new installations of borehole dilatometers and tiltmeters, new installations of continuously recording GPS receivers, improved data logging and telemetry, and development of strain analysis and pattern recognition software.

TOPIC Geology			
PARK :	HAVO	Project Title	Seismic Monitoring of Hawaiian Volcanoes
First Year:	End Year:	Status	Proj Duration
Data Type/Location Various seismic stations on the islands of Hawai'i and Maui, national seismic networks (Advanced National Seismic System)			
Comments: Paul Okubo (okubo@usgs.gov) monitoring also takes place globally by USGS, including AMME, NPSA, WAPA, HALE, PUKE, PUHO, USAR, ALKA, KAHO, and KALA (all PACN parks), this pretty much goes for all volcanic activity, the USGS' job in a broad sense is to monitor for such activity on all American lands and interests. CURRENT MONITORING PLAN			
Data Collected			
Proj Purpose	Seismic monitoring of the active Hawaiian volcanoes began in 1912. Since then, the seismographic network operated and maintained by HVO has expanded to over 60 stations on the Big Island. Data from remote stations are continuously telemetered in real-time to HVO. HVO's network coverage is most dense on Kilauea (Parks: HAVO). A sparser network of stations covers Mauna Loa and the other active volcanoes, Lo'ihi and Hualalai (Parks: PUHE, PUHO, KAHO). The most complete historical, empirical data on location of earthquake epicenters with attributes information for date, depth and magnitude for the other islands might be available from the USGS National Earthquake Information Center (NEIC) (Parks: HALE, KALA).

PARK : HAVO	Project Title Volcanic Activity Monitoring, Current Eruption monitoring, Hawaii Volcanoes National Park
First Year:	End Year: Status Proj Duration on-going
Data Type/Location mapping of lava flows, sampling of new lava, aerial reconnaissance of volcanic activity.	
Comments: CURRENT MONITORING PLAN	
Data Collected for the current eruption much data is collected near the Puu Oo cone.	
Proj Purpose Geologists at HVO track the advance of active lava flows using GPS mapping aids and aerial photographs. Observatory scientists keep detailed descriptions and photo archives, including still and video images, to better understand and forecast future eruptions (Parks: HAVO). Lava, spatter, and other erupted material are sampled for study of their geochemical and mineralogical composition (Parks: HAVO, HALE). Geodetic surveys are taken to precisely depict the growth of flow fields, vents and changes in ground deformation (Parks: HAVO, HALE, PUHO, PUHE, KAHO). In addition, they monitor the volcanoes through direct visual observations of eruptive activity, changes in electrical and magnetic properties, and changes in gravitational attraction (Parks: HAVO). Weekly monitoring(visual and physical sampling and mapping) of current eruption at Puu Oo vent.

TOPIC		Invasives	
PARK :	AMME	Project Title	Brown tree snake monitoring
First Year:	End Year:	Status	In work Proj Duration
Data Type/Location	<p>Saipan - 150 in port areas. Presently traps are being focused into one area near seaport and the airport. There are 20 traps in the AMME wetland. Tinian - ~30 at seaport. Rota - ~ 30 at seaport.</p> <p>Research by the Biological Resources Division of the U.S. Geological Service has produced several designs for a barrier that Brown Tree Snakes cannot breach. In the CNMI the barriers are used to enclose a cargo quarantine yard at the ports of entry. Cargo is placed inside the yard for up to three nights. Along the inside of the barrier snake traps are placed at regular intervals. The idea is that snakes exit the cargo, run into the barrier and follow the edge and running into the traps. While not 100% effective this technique places a snake in an area with a much higher probability of being trapped than out in the forest. This area also provides a suitable place for cargo inspection by Sniffer Dogs.</p> <p>Presently there are snake barriers at the Rota and Tinian seaports. It is planned to construct one for the Saipan port in late 1999 or early 2000.</p> <p>Saipan has two dog (K-9) teams consisting of one dog and one handler. Handlers are Quarantine personnel. In the future more dog teams will be added to Saipan and also expansion to Tinian and Rota.</p>		
Comments:	Also awaiting more information on this once DFW contacts me back. There may be a location in the park. Regardless, this monitoring would be important for park resources (i.e., birds)		
Data Collected	<p>"There is an effective trap in use for Brown Tree Snakes. It consists of a mesh cylinder with one way opening flaps on each end. The snake can get in but cannot get out. To entice the snake into the trap there is a live mouse inside. The mouse is in a wire mesh box so that the snake cannot kill the mouse once inside the trap. The mouse must be fed on a weekly basis. This makes trapping very labor intensive. Never the less, this trap is used extensively on Guam around the sea ports and airport and Guam's Division of Aquatic and Wildlife Resources is using trapping to clear large areas of jungle (>25 hectares) of snakes. We use these traps on Saipan to hopefully capture snakes that have just entered or to locate a rising snake population."</p>		
Proj Purpose	Brown Tree Snake program actively works to prevent the introduction of this invasive species to the Island's. Personnel and inspection teams are located on Tinian, Rota and Saipan. Saipan houses a kennel where 'sniffer' dogs are trained, mice for trapping purposes are reared, and labs and supplies are maintained. The port of Saipan is also installing a quarantine area for vessel shipments (boats and cargo) that have the potential for unknowingly transporting snakes.		
Proj Usefulness	Mark-recapture monitoring of populations of shrews and anoles: A plot is marked off in the jungle and the animals are captured, marked and released. This is done for upto 12 capture events. The number of animals that are recaptured (have been marked previously) compared to those that are new captures (have not been marked) can be used to calculate a population estimate

TOPIC **Invasives**

PARK : **HALE** Project Title **Alien Plant Transects in Kipahulu**

First Year: End Year: Status **In work** Proj Duration

Data Type/Location **Started in 1996-7 and ongoing. Use belt transects that are 50 meters apart. A system of weed monitoring transects beginning from the Charlie fence line at 4800 ft on the upper shelf down to at least the Dogleg fence at 2200 ft on the lower shelf are needed to track alien species invasions upward into pristine areas. They are to be laid out on existing trails and USFWS Bird Transects.**

Two transects on the upper shelf have been initiated; one on the Central pali trail on June 22-23 1992 by Steve Anderson, Art medeiros and Patti Welton, and one on USFWS Transect #17 on October 20, 1993 by Bill Haus, Larry Olney and Patti Welton and furthered on January 26, 1995 by Paul O'Conner and Patti Welton. The lower portions of both these need to be completed to reach the Dogleg fence. Work on the two lower shelf transects still need to begin. One will be at the base of the Central pali on the original USFWS Transect #16 and one along the Palikea Stream trail. Relocation of the top portions of these trails is priority. Four transects running from the Charlie fence to the Dogleg fence will be permanently marked and sampled. The sampling frame will be a belt transect 5 meters wide (2.5m on each side of the center of the trail) with data recorded for each 50 m segment. Each monitoring unit will thus be an area of 250 square meters. At the Charlie fence there will be a metal tag identifying the transect and the beginning as 0 meters. Every subsequent 50 meters there should be another piece of orange and black flagging tape tied to a persistant piece of foliage i.e. sturdy tree, with the transect # and distance from the beginning clearly written with a Sharpie or wax pencil marked i.e. WEED #3-50 m. The transect will be set up by using a hip-chain to measure every 50 m. It is imperative that the hip-chain string be collected after each interval is measured.

Comments:

Data Collected **Cover abundance in 8 classes. Frequency is determined by a presence/absence for a species for each 50 meter segment. Elevation Weed Transect #1 was initiated 10/20/93 for stations 0m-1450m and 1450m-2600 was done 1/26/95. 0m-2450m was done 9/16/97. On 2/9/05 0-1900m was monitored for kahili ginger only. Elevation Weed Transect #2 was initiated 6/22-23/93 from 0m-3500m, 10/19/93 from 0-700m, 2/4/98 0-1200m were done, 8/14/01 0m-1900m done. Elevation Weed Transect #3 was initiated 5/19-20/98 from 0m-3800m was done. Elevation Weed Transect #4 was initiated 10/22/98 0-2150m done, 1/11/98 2150-3600m done**

PARK : HAVO	Project Title Feral Goat Control						
First Year: 1971 End Year: 1975 Status In work	Proj Duration on-going						
Data Type/Location							
Comments: Main efforts to control feral goats at HAVO were conducted from 1971-1975. Monitoring for ingress is on-going within the park. CURRENT MONITORING PLAN							
Data Collected Resources Management has catch summaries							
Proj Purpose The initial goal of the feral goat control project at Hawaii Volcanoes National Park was to remove all goats within the park boundaries. The initial goal was basically met, and monitoring of ingress to the park continues. Using the "Judest Goat" protocols where an individual goat is radio collared and released, then joins up with an existing herd. These "Judest goats" are monitored every three months, and individuals of the herd are shot, except for the Judest goat. Monitoring is done on Mauna Loa, East Rift of Kilauea, and the Great Crack

PARK : HAVO	Project Title Small mammal trapping
First Year: 1994 End Year:	Status In work Proj Duration
Data Type/Location Sm. mammal trapping has been a part of the nene program for approx. 30 years. Trapping has occured regularly since 1994 and was conducted on a more spordic basis prior to that. Trapping is primary focused in brooding areas and some nesting areas. Perimeter trapping as well as throughout an area are the most common tactics, not exactly transects. We also focus trap placement along roads and trails leading into sensitive areas (cats often use roads).	
Comments: Trapping for both species is generally limited to their respective breeding seasons (and for a period prior to the onset).	
Data Collected	
Proj Purpose To protect nene and petrel	
Proj Usefulness

PARK : NPSA	Project Title Monitoring Invasive Trees and Plants	
First Year: 2003 End Year:	Status In work	Proj Duration
Data Type/Location Invasive plant transects.		
Comments: American Samoa Community College (Land Grant) has started an inventory and analysis of forest types (one-time project) which entails a land-cover map of all American Samoa of forest types. This includes plot work, one plot is in the Park (Tau). Removal of invasive trees started Dec. 2003. Tavita and VIP team have removed several invasive trees (tamalini palagi) on Tutuila within park boundaries. American Samoa Invasive Species Team (ASIST) consisting of various agencies in the territory has been established to monitor and remove invasive plant species. In 2004, ASIST conducted a weed survey in the territory and documented the locations.		
Data Collected In 2003, distribution and abundance of invasive trees and 2004, GPS coordinates of invasive plant species.		
Proj Purpose Monitoring invasive trees and plants in the park and territory.		
Proj Usefulness Information helps prevent, control, and eradicate invasive plant species.

PARK :		WAPA	
Project Title		Brown tree snake monitoring	
First Year:	End Year:	Status	In work
Proj Duration			
Data Type/Location			
Comments:	<p>emailed usgs for more specific information on their monitoring protocol. They have very general information online. (08 June 05). Information in the project purpose and usefulness are copied and pasted from the usgs website. To my knowledge this monitoring may be conducted outside of the park, but it is relevant to the park resources. I am trying to verify whether there are regular monitoring sites located in any of the park units (8 June 05)</p>		
Data Collected			
Proj Purpose	<p>To reduce the risk of snakes dispersing from Guam, trapping and visual searches are conducted in and around facilities through which air and sea cargo pass. Trapping and other control techniques are also used in patches of natural habitat on Guam where some of the endangered species can be maintained and numbers augmented. Islands of habitat protected by snake-excluding barriers are integral to wildlife conservation efforts on Guam. The use of barriers to reduce snake movements is being expanded to include airfields and sea ports on islands identified as high risk for brown tree snake introduction. Trapping and searches are also being used at port and airport facilities on some of these high-risk islands. Of special concern are islands in the State of Hawaii and the Northern Marianas, because of the high frequency of traffic coming from or through Guam.</p>		
Proj Usefulness	<p>The knowledge gained from control efforts on Guam will be employed to eradicate newly established populations on other islands and prevent further ecological damages by the snake. It is important to note that, while the brown tree snake has been extremely successful as a generalist predator on Guam, it is probable that this risk is not limited to the species <i>Boiga irregularis</i>. Other species of the genus <i>Boiga</i> have similar habits and characteristics. Many other species of snakes could cause similar damage to ecosystems and other problems in introduced situations where co-evolutionary histories between predator and prey are absent. Lessons and technology acquired through efforts to control the brown tree snake on Guam, such as early detection, trap design, and portable barriers for use in response to snake sightings, can be extended to future situations in other geographic areas to eradicate the dispersers before they are able to cause large-scale disruptions.</p> <p>Numerous government agencies have contributed funds and participated in programs to develop effective control programs for brown tree snakes on Guam and to prevent its continued dispersal. Key participants include the U.S. Department of the Interior, U.S. Department of Defense, U.S. Department of Agriculture, U.S. Department of Transportation, the State of Hawaii, and the Territory of Guam. In addition to these governmental agencies, numerous officials and professionals from government and private agencies and nonprofit organizations are working to prevent the brown tree snake's spread into the State of Hawaii. Hawaii has long been subjected to the destructive capabilities of invasive species such as <i>Culex pipiens fatigans</i>, the mosquito that brought avian malaria and devastation to the native bird species. Actions being taken to prevent the arrival of the brown tree snake include educational campaigns, canine and handler inspection teams, trapping in the vicinity of snake sightings, and construction of barriers in critical transportation facilities to assist detection and capture of snakes that might otherwise escape into vulnerable habitats. All of these efforts are important to protect the Hawaiian ecosystems and their many endemic species from an introduced predator such as the brown tree snake.</p>

TOPIC marine mammals	
PARK : ALKA	Project Title Hawaiian Islands Humpback Whale National Marine Sanctuary Ocean Count
First Year: 1999 End Year:	Status In work Proj Duration
Data Type/Location	Site locations on the Island of Hawaii along the proposed ALKA corridor include Upolu Point, Old Coast Guard Road, Kapaa Beach Park, Lapakahi State Park, Puukohola Heiau, Mile Marker 7, Hualalai Four Seasons, Keahole Point, Keauhou Lookout, Honaunau Lookout, Hookena Beach Park, Milolii Lookout, Punaluu Beach Park, Kaena Point and Kahena Lookout.
Comments:	This entry is also relevant and should be added for PUHE, PUHO, KAHO and maybe HAVO. Entered by Raychelle 27 June 2005
Data Collected	The first count was conducted in February 1996 on O'ahu, with approximately 150 volunteers. In 1999, the Big Island was added to the effort. Kaua'i began participating in 2000 and Kaho'olawe began participating in 2002. To date, the Sanctuary Ocean Count covers 60 sites on four islands, with an enlistment of over 3000 volunteers. Volunteers assist in the data collection procedures and a site leader monitors their work at each site. Data collected during the Ocean Count are screened for consistency and entered into a database for further analysis.
Proj Purpose	The Sanctuary Ocean Count was initiated as a means to provide Hawai'i residents and visitors with the opportunity to actively participate in evaluating the status of humpback whales in their breeding grounds by conducting a yearly shore-based census during the peak breeding season. Although the census does not claim to provide scientifically accurate results regarding abundance and distribution patterns of humpback whales around the main Hawaiian Islands, it serves as a tool to supplement scientific information gathered from other research activities. The count also serves to promote public awareness about humpback whales and shore-based whale watching opportunities, and to get a sense of how whales use inshore waters on an average peak season day.
Proj Usefulness

TOPIC marine mammals	
PARK : KAHO	Project Title Spinner Dolphin
First Year: 1968 End Year:	Status In work Proj Duration
Data Type/Location Survey from Honokohau Harbor to Noio Point to Mano Pt. and on some occassions, Kealakekua Bay and Kauhako Bay.	
Comments: raychelle created entry 27 June 2005; This record is very relevant to ALKA too. Could be relevant to PUHE and PUHO, but ask Page.	
Data Collected photo identification of individuals allowing for estimation of population size, starting in 1979	
Proj Purpose Beginning in the spring of 2003, the Kula Nai'a Wild Dolphin Research Foundation is once again conducting research on the dolphin populations found along the Kona coast of the Island of Hawai'i. The research effort is partially funded by a contract from the National Marine Fisheries Service. This project expands on the foundation's long running study of the resident population of Hawaiian spinner dolphins (<i>Stenella longirostris</i>) and will now also study the local spotted (<i>Stenella attenuata</i>) and bottlenose dolphin (<i>Tursiops truncatus</i>) populations. These dolphins are also frequently sighted within a few miles of shore. The current research effort is focused on building photo-ID catalogues of uniquely marked individuals and studying the population structure, habitat usage, movement and residency patterns of spinner, spotted and bottlenose dolphins. To facilitate management of these species, the Kula Nai'a Foundation will also collect data on human activities around these protected delphinids	
Proj Usefulness The research on spinner dolphins, off the Island of Hawaii represents the longest running study of spinner dolphins in the world and one of the longest running studies of any dolphin species, spanning over 30 years. The research has been carried out in four separate studies, involving Ken Norris and several of his colleagues, postdoctoral and graduate students.

PARK : KALA		Project Title Monk seal monitoring	
First Year: 1997	End Year:	Status In work	Proj Duration
Data Type/Location			
Comments: monitoring in the park.			
Data Collected daily observational counts, identification of tagged individuals			
Proj Purpose The park, with NMFS, is actively observing, protecting and managing endangered monk seals that haul out in the park.			
Proj Usefulness Hawaiian monk seals are one of the most endangered of all seals with only a total population estimate of 1400, including only around 60 seals in the Main Hawaiian Islands (MHI). At least twelve seals are known from Kalaupapa National Historical Park (KALA) waters, comprising as much as 20% of the MHI sub-population of monk seals. KALA has played a major role in the MHI monk seal population recovery with eight births recorded in the past six years and four births this year. These four represent 40%, nearly half of MHI monk seal births for this year according to birth data obtained from NMFS.

PARK :	HAVO	Project Title	Hawksbill turtle monitoring program
First Year:	1989	End Year:	
Status	In work	Proj Duration	on going
Data Type/Location	data on Excel spreadsheets, located in turtle office, at Resources Management office, Hawaii Volcanoes National Park		
Comments:	CURRENT MONITORING PLAN		
Data Collected	Daily & nightly nesting activity during the nesting season (end-May to early to late December) Predator information		
Proj Purpose	Documentation of nesting activity of the endangered Hawksbill turtle at HAVO beaches, and nesting beaches located outside of the National Park (Kamehame,Punaluu, Kawa, Ninole. Pohue, Horseshoe, and Kaloa). Hawksbill turtles (federally listed as endangered) frequently nest on beaches within the park. Turtle nesting has been observed at three beaches: Halape, Keauhou Landing, and Apua, with Apua having the longest history of documented nesting. The park has only recently started observing nesting at Halape and Keauhou, so data at these beaches is limited. Data for other beaches does not exist.		
Proj Usefulness	Methods of collection if investigators have nesting turtles in their park.

PARK :	WAPA	Project Title	Turtle Program
First Year:	End Year:	Status	In work Proj Duration
Data Type/Location			
Comments:	These likely occur at Ritidian and Cocos; however, Dwayne agreed that since sea turtles use the park resources, this record does pertain to the park.		
Data Collected	The number of nests found for both Chelonia mydas and Eretmochelys imbricata between FY75-00 (with not all years surveyed). Aeiral surveyes.		
Proj Purpose	Division of Aquatic and Wildlife Resources (DAWR) Sea Turtle Recovery Program (STRP) is funded in part by the NMFS Honolulu, PIAO to determine the extent of Guam's resident/nesting sea turtle populations and nesting habitats by conducting beach surveys and satellite tracking. ComNavMarianas has funded part of the satellite telemetry portion of the project through the purchase of satellite tags and satellite time. The objectives of the project are: To collect baseline population size-structure (age and size) and genetic information for sea turtles in and about Guam. To survey Guam's beaches for sea turtle nesting activity for both green turtle (Chelonia mydas) and hawksbill (Eretmochelys imbricata) throughout the nesting period in order to determine the size of the nesting population of sea turtles on Guam and to employ a variety of tagging techniques to determine movement, residency and further define population dynamics. To establish a Guam based sea turtle-working group consisting of natural resource stakeholders and involve them in the refinement of the implementation plan.

TOPIC **Vegetation**

PARK : **HALE** Project Title **Bog Data**
 First Year: **1973** End Year: Status **In work** Proj Duration

Data Type/Location Greensword Bog: We established five 10 m transects in the central, severely disturbed portion of Greensword Bog. End points of each transect were marked with a 518-inch PVC pipe. At each sampling date, a metric tape was stretched between the marked ends of each transect. A 1-meter square PVC plot frame, placed sequentially at 1 m intervals along the tape, was used to define plots. A total of 20 plots were sampled, 10 plots on each side of the 10 m long transect. Using this procedure, it was possible to resample virtually identical 1 m² areas in subsequent years. Within each 1 m² plot, cover was visually estimated to the nearest 5% for each vascular plant species. Estimated cover less than 2.5% was recorded as 1%. Two workers made estimates independently, then reached a consensus on values to be recorded. In practice, the technique worked reasonably well and appeared repeatable in this unlayered type of vegetation. To supplement this information, photographs (35mm slides) were taken of plot #5 of each transect, as well as of the overall transect from each end. Sampling was initially carried out six weeks after the fencing and repeated annually from 1981 through 1987 (seven times). All data and photographs are on file at the Research Office, Haleakala National Park.

Big Bog and Mid-Camp Bog: Three primary vegetation types were identified in the study area, based on dominance of three native sedge species - *Oreobolus furcatus*, *Carex echinata*, and *Carex alligata*. Stands of the tall (to 1.5 m) native sedge *Carex alligata* were not sampled since these stands are virtually monospecific and lack diversity and are not subject to damage by pigs. At the start of the project in 1982, eleven 100 m² (10 m x 10 m) quadrats and two 10 m transects were established in sites chosen as representative of the other two communities, seven quadrats in *Carex echinata* and four quadrats and two transects in *Oreobolus* (Figure 3). All four corners of each quadrat were marked with PVC pipes; two corners were wired with stamped metal identification tags. Twenty 1 m² plots were placed within each 100 m² quadrat, with ten plots along each of opposite sides; the 100 m² quadrats were also divided into four 25 m² subquadrats (Figure 2). For each species, presence/absence and an estimate of cover to the nearest 5% were recorded in the plots and subquadrats. The twenty 1 m² plots were sampled using a meter-square PVC plot frame placed along a meter tape stretched between PVC poles, allowing accurate relocation of plots. To maximize continuity, one observer (the senior author) was present during each of the four sampling times over the six-year period. Observers estimated cover independently, then discussed and agreed on the final figure. The cover of uncommon species was estimated first, that of dominant species last. To increase standardization of estimates, methods were carefully reviewed prior to each sampling. Species with less than 2.5% or 2.5 dm² cover were recorded as "present" (1% for calculations), cited as "negligible" in text. Two sites (12 and 13), consisting of small areas of exceptionally intact *Oreobolus* turf, were sampled by a transect of ten 1 m² plots.

Comments: From 1974 to 1980, field biologists B.H. GagnC, J.D. Jacobi, R.J. Nagata, and A.Y. Yoshinaga began increasingly to record observations of substantial disturbance of native vegetation in Haleakali's bogs by feral pigs. Bogs were fenced in 1979, 1981, 1983, and 1987.

Data Collected Greensword Bog: vegetation cover- repeated annually from 1981-1987. Big Bog and Mid-Camp Bog: presence/absence and percent cover. The sites were sampled four times at roughly two year intervals, in September 1982, October 1984, December 1986, and October 1988. Two sites in Big Bog (10 and 11) were enclosed by fencing in April 1987; the remainder of the sites, in Mid-Camp Bog, were enclosed by fencing in August 1988, two months prior to final sampling. Photographs of quadrats, transects, and plots were taken to supplement quantitative data.

Proj Purpose Monitoring began in 1973 and was repeated in 1977. Some bogs were fenced and monitoring took place annually from 1981-1984. Vegetation communities in the bogs were monitored for change in 1982, 1984, 1986, and 1988. Monitoring was repeated in 2001.

TOPIC Vegetation	
PARK : HAVO	Project Title 'Ohi'a lowland community restoration project-Outplant success
First Year: 2002 End Year:	Status In work Proj Duration on-going
Data Type/Location	Hilina Pali rd.: one ohia dieback site(131 ac), one grass site(w/ 3 dif. Treatments)(100 ac). 12-16 native spp planted at high, med., low or 0 densities at nodes along transects . Initial outplant goals>7500 plants, have increased significantly
Comments:	monitoring may continue for 10-30 years at 10 year intervals after monitoring at 1 & 5 years. CURRENT MONITORING PLAN
Data Collected	Survivorship and vigor of individual outplanted plants monitored at 1 year.
Proj Purpose	Restore 'ohi'a lowland communities to conditions as natural as practicable . Full restoration is not expected, instead, the intent is to create modified native communities that are able to self-perpetuate, accepting that alien grasses remain important ecosystem components. Monitor efficacy of different restoration techniques Key Questions: How does seedling recruitment differ between recipient vegetation microsites? To what extent do grass removal techniques influence outplanting success and seedling recruitment? What combination of outplanting and seed reintroduction will effectively meet management goals?
Proj Usefulness	Relative success of outplanting of fire tolerant species in dieback area and grass area. Relative success of outplanting at High ,Med, Low densities of plants. Relative success of outplanting in grass areas following chemical, mechanical or no removal and in areas rototilled to imitate ungulate disturbance comparison of outplanting and seeding areas in this area may allow managers to design more effective revegetation strategies

TOPIC	Vegetation		
PARK :	HAVO	Project Title	Complete reintroduction of endangered Silversword
First Year:	2000	End Year:	Status In work Proj Duration scheduled for start FY04-05, follows earlier preliminary outplantings
Data Type/Location	Mauna Loa Strip Road , In and near exclosures at 7000 and 6800 ft elevation, Kipuka Kulalio, Kipuka Maunaiu, Mauna Loa Trail-above trailhead & below ungulate fence		
Comments:	Unable to interview Ane/Tim before holiday, Also see earlier Silversword Projects (starting 1998?). CURRENT MONITORING PLAN		
Data Collected	Height, rosette diameter,vigor, mortality, phenology monitored at 6 month intervals for the first year, and yearly intervals after that Natural seedling recruitemnt also monitored. Future years will monitor phenology for all plants in the reintroduced population and track subsequent seedling establishment		
Proj Purpose	Measure growth and determine mortality of a 10% subset of 125,000 out-planted silverswords on Mauna Loa		
Proj Usefulness	Determine success of restoration programs for Silversword,Genetic considerations		
Oranizations associated with this Project:		Theme Keywords associated with Project:

TOPIC Vegetation										
PARK : HAVO	Project Title Koa recovery inside and outside experimental ungulate proof fence enclosures in Kahuku									
First Year: 2003 End Year:	Status Planned Proj Duration on-going									
Data Type/Location 3 paired 35x 35 m treatment plots located in 3 kipuka in Kahuku-one plot fenced (ungulates excluded , one unfenced										
Comments: Completion of Phase one report due May 18, 2005, Rhonda Loh will forward a copy. CURRENT MONITORING PLAN										
Data Collected Species richness(at 0, 2 yr) cover along three,30m long transects(at 0, 2 yr) stem density of Koa,koa size classes, (0,6,12,18,24 mo.) survivorship/ damage of a tagged subset of koaseedlings(6,12,18,24mo.) Initial Baseline monitoring to be completed.										
Proj Purpose Evaluate natural recovery of Acacia Koa by root sprouting and/ or seedlings in previously logged forests in kahuku Ranch. Measure the response of alien and native plants to release from ungulate pressure. Monitoring objective : to monitor recovery around logged versus live trees, monitor enclosure effects on Koa recovery, and monitor long term recovery of Koa outside of enclosure										
Proj Usefulness What is the natural recovery of Koa in Kahuku in the absence of feral ungulates? What is the species composition of rare and alien plants in Kahuku?										
<div style="display: flex; justify-content: space-between;"> <div> <p>Organizations associated with this Project:</p> <div style="border: 1px solid black; padding: 5px; width: 60%;"> US National Park Service </div> </div> <div> <p>Theme Keywords associated with Project:</p> <div style="border: 1px solid black; padding: 5px; width: 35%;"> feral ungulates vascular plants weed distribution </div> </div> </div>

TOPIC Vegetation		
PARK : HAVO	Project Title Low Density Pig Project-vegetation	
First Year: 1997	End Year: 2003	Status Complete Proj Duration
Data Type/Location `Ola`a tract: Pu`u Unit, "new exclosure" and unfenced area; Pu`u Maka`ala NAR. 6 paired 20 x20 m vegetation plots near exclosure boundaries (each plot in exclosure paired with one nearby not protected from pigs)		
Comments: Similar study completed in Kamakou Preserve, Molokai. NOT CURRENT MONITORING PLAN.		
Data Collected ground cover, pig -sensitive(preferred forage) species counted and measures, alien plant frequency determined and cover-abundance estimated with Braun-Blanquet scale Established 1997, remonitored in 2003		
Proj Purpose Determine effects on vegetation of low density feral pig populations		
Proj Usefulness Established plots for studying impacts of varying densities of feral pigs on montane wet forest vegetation. How does vegetation react to removal/ reduced density of feral pigs? Do preferred forage species (Hapuu, Astelia, Cyaneas, Clermontias etc.) rebound following removal of pigs? Are there significant differences in vegetation between areas with low-density pig populations and pig free areas?

TOPIC Vegetation	
PARK : HAVO	Project Title Panau Iki Burn Revegetation project (565 ac)
First Year: 2003 End Year: 2008 Status In work	Proj Duration planting 2003-2006 monitoring 2004-2008
Data Type/Location Plant establishemnt efforts are to be concentrated in ~450 circular plots (15 m radius) established along transects that span the area.	
Comments: Monitoring may continue at 10 year intervals for 10-30 years. CURRENT MONITORING PLAN. Methodologies avery similar to those being used in KUPUKUPU burn area revegetation project, with exception of use of fire-sensitive species	
Data Collected Monitoring of recovery in order to ases the success of the revegetation effort will take place at 20-50 vegetation plots inside and outside planting nodes. Outplant success, seedling recruitment of 4 fire tolerant sp. From direct seeding and overall vegetation recovery will be evaluated at 1,2, and 5 years following the burn.	
Proj Purpose Monitor Efficacy of Restoration Efforts in Fire-damaged Area Re-vegetate with native plants a 540 acre `ohi`a woodland/native shrubland damaged by a fire that began February 2003. Prevent establishment of aggressive non-native woody species.Approximately 10000 plants composed of >15 native species will be established by direct seeding and outplanting into ~450 plots along transects spanning the area. Control of Faya Tree, Strawberry Guava, and other aggressive non-native woody species by mechanical or chemical treatment will be used to prevent them from invading and dominating the post-burn environment.	
Proj Usefulness Relative success of revegetation efforts in a burned area by direct seeding and outplanting.

TOPIC		Vegetation	
PARK :	HAVO	Project Title	Pili prescribed burn experiments: Established vegetation
First Year:	End Year:	Status	In work Proj Duration began 2000?, 10-15 yr project
Data Type/Location	Remnant Pili grassland, base Holei Pali. Wildfire in 1992. Presc. Burns in 100x200m blocks. 3 burn treatments, 1 control. Burning treats.= one burn, every 2.5 yr, every 5 yr. over 10-15 yr period. 23 total blocks, focusing on 3 per treat.=12 blocks		
Comments:	original plans to monitor a larger number of treatment plots were scaled back due to lava, funding. CURRENT MONITORING PLAN		
Data Collected	Established vegetation monitored		
	Frequency, plant cover, grass density, shrub density, tree density - in 3 subsamples per treatment plot		
	Grass survivorship, shrub survivorship, tree survivorship- for 18 individuals per sp per treatment plot		
	Soil seedbank- 10 soil cores per treatment plot to be collected at 4-6 mo. Intervals		
	Invasive grass removal plots- removed all invasive grass sp within 10 4x4 m plots to test the response of native species with or without fire in the presence or absence of invasive grass species		
Proj Purpose	Monitor recovery of Pili grassland in 3 different prescribed burning regimes		
	Determine if Pili grasslands can be maintained or expanded, and the presence of exotic species reduced through the use of prescribed burns		
Proj Usefulness	Response of established vegetation to fire

TOPIC **Vegetation**

PARK : **HAVO** Project Title **Pili prescribed burn experiments:Seed addition experiments**

First Year: End Year: Status **In work** Proj Duration **began 2000?, 10-15 yr project**

Data Type/Location **Remnant Pili grassland, base Holei Pali. Wildfire in 1992. Presc. Burns in 100x200m blocks. 3 burn treatments, 1 control. Burning treats.: one burn, every 2.5 yr, every 5 yr. over 10-15 yr period. 23 total blocks, focusing on 3 per treat.=12 blocks**

Comments: **original plans to monitor a larger number of treatment plots were scaled back due to lava, funding. CURRENT MONITORING PLAN**

Data Collected **In each of the 12 focal blocks discussed below there are 48 2x2m seed addition plots of the 48 :**

**1/2 are on rock tumulus, 1/2 are in grassy depressions
1/2 were seeded preburn, 1/2 were seeded postburn
16 were seeded with "seed cocktail a"
16 were seeded with "seed cocktail c"
16 were seeded with "seed cocktail e"**

Each of the three seed cocktails contains a different mixture of 16 total species of Native & Non-Native Fire Tolerant and Fire Sensitive plants in on of three different mixes ("seed cocktails")

In each plot seed recruitment, was read at 1 yr, up to 5 of each species in each height class were read at 3-6 mo., % cover (braun-blauquet) read at 1 yr postburn

Proj Purpose **Test the response of selected lowland native species to frequent fires**

Proj Usefulness **efficacy of restoration efforts, recovery of native species exposed to and not exposed to fire. May help for planning restoration efforts in areas that are likely to burn**

PARK : HAVO	Project Title Rehabilitation of Koa and Koa-'a'e forest on lower Mauna Loa-outplanting	
First Year: 2002	End Year: 2007	Status In work Proj Duration Outplanting began some sites 1998
Data Type/Location 3 sites on Mauna loa (Soapberry bend(5 subsites), Fence line, Spur road) where grasses have been herbicided and outplanting has been initiated(outplanting initiated beginning in 1988-Jan 2004). 1-4 treatment and control 20 x30 m FMH Plots in each site		
Comments: See also seeding project. CURRENT MONITORING PLAN.		
Data Collected 5 year FMH Plots: Cover, Frequency(species list), Tree density by height class for all sp, shrub density Baseline plots established in March 2002, will be reread in 2007		
Proj Purpose Restore koa montane dry forest, koa montane mesic forest, koa/'ohi'a/'a'e montane mesic forest Monitor efficacy of restoration efforts- herbiciding of grasses and outplanting		
Proj Usefulness vegetation community composition with and with out management, restoration success

TOPIC Vegetation										
PARK : HAVO	Project Title Vegetation Recovery in the May 2002 Kupukupu Burn									
First Year: 2003 End Year:	Status In work Proj Duration on-going									
Data Type/Location ~13000 fire tolerant plants direct seeded/outplanted in 250-300 plots (15m radius) . Fire sensitive spp.seeded/ planted in 3 sets of 3 plots(radii: 5m, 15m, 25m) to create stands less penetrable to fire. Annual removal of invasive woody sp.										
Comments: Monitoring may occur at 10 year intervals for 10-30 years following the 5th year monitoring SENSITIVE DATASET: PARK ONLY; Entered from proposed action statement provided by sierra mac daniels. CURRENT MONITORING PLAN										
Data Collected Outplant success, seedling recruitment from direct seeding and vegetation recovery will be evaluated at 20-50(HOW MANY?) vegetation plots inside and outside planting nodes at 1,2,5 years following the burn										
Proj Purpose Monitor Efficacy of Restoration Efforts in Fire-damaged Area 1) establish fire-tolerant and fire-sensitive native plant associations in a 455 acre recently burned area that was formerly 'ohi'a/swordfern. 2)develop methodologies for establishing dense stands of fire-sensitive native species 3) control aggressive non-native woody species to prevent them from invading and dominating the post-fire environment										
Proj Usefulness success of outplanted sp in a fire recovery area, efficacy of dense stands of fire sensitive sp. For protection from fire.

TOPIC	Vegetation		
PARK :	NPSA	Project Title	Long-term Monitoring Plots (LTMPs) of Trees
First Year:	1999	End Year:	
Status	In work	Proj Duration	monthly data collected since 1999
Data Type/Location	Four 1.2 ha permanent forest plots in Tutuila. Trees marked with a numbered metal tag.		
Comments:	Similar work on Tau starting in Summer 2004 by Webb; however in February 2005, Cyclone Olaf caused severe damage to the vegetation on Tau. Webb revisited plots April 25-May 12, 2005 to assess damage. Metal tags were still attached; however most of the trees had fallen, thus it was difficult locating tags, etc.		
Data Collected	Monthly phenological census. Forest composition and structure.		
Proj Purpose	Census to determine new recruits and mortality patterns of trees (Webb's). First investigation (1999) was of spatial variation of rainforest tree community structure and composition to determine if forest structure and diversity varied as a function of topography; and in turn if this could influence patterns of habitat use by native forest birds and pteropodid bats.		
Proj Usefulness	Excellent tool for a wide variety of ecological studies.

TOPIC Vegetation	
PARK : PUHO	Project Title Roadside Weeds Survey
First Year: 2001 End Year:	Status In work Proj Duration Dependent on availability of assistance for surveys
Data Type/Location Surveyors walk major roadsides on Hawaii Island. Both sides of the roadside are walked, as statistically significant differences are found in weed species on either side of the road.	
Comments: Weed community assemblage on either side of the road has been found to have statistically significant differences. NOT MONITORING--MOVE TO DATASET CATALOG	
Data Collected Survey of presence of weeds on major roadsides on Hawaii Island	
Proj Purpose Survey of presence of weeds on major roadsides on Hawaii Island-Includes roads near PUHO	
Proj Usefulness Documents presence of weeds, incipient invaders in and near the park. May allow resource management to more rapidly address priority weeds. Frequency of weed species, new records , distribution.

TOPIC **Visitor Use**

PARK : **HALE** **Project Title** **Visitor Use Monitoring****First Year:** **1979** **End Year:** **Status** **In work** **Proj Duration**

Data Type/Location **Crater District:** 1) An inductive loop traffic counter is located on the entrance lane to the park on Haleakala Highway. The traffic count is reduced for nonrecreation vehicles (800 per month), nonreportable vehicles (550 per month), and buses (to determine the number of buses, divide the paying and nonpaying bus visitors by 23 (average persons per bus)). The reduced traffic count is multiplied by the persons-per-vehicle (PPV) multiplier of 2.7. 2) The number of paying bus visitors is determined from SF-215 deposits from commercial bus operators. 3) The number of paying bus visitors is multiplied by 0.20 to estimate the number of golden age visitors (non-paying) and the number of tour bus visitors entering after the station is closed. **Kipahulu District:** 4) An inductive loop traffic counter is located on Highway 31 covering both lanes. The traffic count is divided by 1.9 to reduce for duplicate counting (this takes into account 4 wheel drive vehicles that cross the counter only once). The reduced traffic count is reduced for nonrecreation vehicles (620 per month), nonreportable vehicles (200 per month), and tour vans. The reduced traffic count is multiplied by the PPV multiplier (2.7). 5) The estimated count of tour vans as reported by park rangers is multiplied by the persons-per-van multiplier of 10. **Nonrecreation visits:** **Crater District:** 1) The number of nonrecreation vehicles (800 per month) is multiplied by the nonrecreation PPV multiplier of 2.1. **Kipahulu District:** 2) The number of nonrecreation vehicles (620 per month) is multiplied by the nonrecreation PPV multiplier of 1.2. **Recreation Visitor Hours** Recreation visitor hours are the sum of the subtotals of each of the categories listed in Table 1 (see <http://www2.nature.nps.gov/stats/>). Each subtotal is the results of multiplying the number of visitors associated with that category by its length-of-stay multiplier. **Nonrecreation Visitor Hours** The number of nonrecreation visitors is multiplied by 1.0 hour for Crater District and 10 minutes (0.166) for Kipahulu District. **Overnight Stays** NPS Campgrounds - Hosmer Grove Campground, O'heo Campground. The actual count of persons staying overnight as reported by park ranger observations. **NPS Backcountry** - All locations The number of nights stayed by backpackers and horse campers. **NPS Miscellaneous** - Holua Cabin, Kapalaoa Cabin, Paliku Cabin The number of nights stayed by cabin users. **Special Use Data:** The number of O'heo interpretive hikes, the number of O'heo hikers, the number of vehicles at Kipahulu District, the number of vehicles at Crater District, the number of tour vans at Kipahulu District, the number of tour buses (The number of tour buses is estimated by dividing the paying bus visitors and golden age visitors by 23.

TOPIC **visitor use**

PARK : **USAR** Project Title Visitation Statistics

First Year: End Year: Status In work Proj Duration

Data Type/Location Data collected will differ by park. These methods can also be found BY PARK at:<http://www2.nature.nps.gov/stats/>
See park specifics below:
USAR: Monthly public use reports are entered on Form 10-157. The following information is collected: 1) Recreational visits: the number of visitors who take the complete tour (movie and boat); the number of visitors who enter the visitor center but do not take the complete tour; the number of visitors after 5pm and before 7am who enter the grounds but do not enter the visitor center; and the number of visitors transported to the USS Arizona memorial by the US navy but do not enter the visitors center. Total recreational visits are the sum of those in number 1. 2) Non-recreation visits are the number of US navy personnel going to the USS Arizona Memorial for reenlistment ceremonies 3)recreational visitor hours: the total recreation visits are multiplied by two hours. 4) non-recreation visitor hours: The total non-recreation visits are multiplied by two hours.

WAPA: Monthly public use report - the following information is recorded on form 10-157. Recreation visits: 1) the number of visitors entering the visitor center. 2) the number of special use visitors. 3) the number of visitors to Asan Pt. (estimated). 4) the number of visitors to Asan Bay Overlook (est). 5) the number of visitors to Apaca Point (est). 6) the number of visitors to Gaan Point(est). 7) the number of visitors to Piti Guns (est). 8) The number of visitors to Rizal Pt (estimated). Non recreational visits: the actual number of non-recreational visitors entering the park. Recreational visitor hours: Recreation visitor hours are the sum of the subtotals of each of the locations (visitor center, Asan Point, Asan Bay Overlook, Apaca Pt., Gaan Pt., Piti Guns, Rizal Pt., & special use visitors). Each subtotal is the result of multiplying the number of visitors associated with that location by its length-of-stay multiplier. Non-recreation visitor hours: The number of non-recreation visitors is multiplied by thirty minutes (0.5 hour).

Comments: Raychelle created entry for WAPA and USAR on 30 June 05; This record pertains to ALL parks with the EXCEPTION of AMME and ALKA (not in the database)
There are also estimates for visitor spending and economic impacts by park and by state, please see:
<http://www.prr.msu.edu/yayen/NPS/NPSSelect.cfm>

Data Collected USAR: data online dates back to 1985 Data for each park can be found at <http://www2.nature.nps.gov/stats/>
WAPA: data online dates back to 1981 all PACN parks have different time periods depending on opening date
HAVO: data online dates back to 1921
HALE: data online dates back to 1960
KALA: data online dates back to 1996
KAHO: data online dates back to 1988
NPSA: data online dates back to 2002
PUHO: data online dates back to 1973
PUHE: data online dates back to 1974

Proj Purpose monitor the number of visitors and estimate the time spent at parks and park attractions by visitors; The objective of Director's Order 82 (DO82) is to set forth policy and procedures for collecting and reporting public use data at the units of the National Park Service, and can be found at: http://www2.nature.nps.gov/stats/do_82.pdf

TOPIC Water Quality	
PARK : ALKA	Project Title Comprehensive Environmental Monitoring Program (CEMP)
First Year: 1982 End Year:	Status In work Proj Duration on-going
Data Type/Location Located around Keahole Point in west Hawaii; 21 groundwater monitoring wells, 2 anchialine pools, 2 aquaculture outfall trenches, 11 coastal sites, and 6 offshore transects with surface and bottom stations.	
Comments: Aquaculture facility bringing up both surface and abyssal seawater for farmers growing a variety of organisms from microalgae to fish and shellfish. Used water is discharged into "injection wells" which are typically exposed trenches.	
Data Collected From 1982 to 1992; weekly sampling of incoming seawater (surface and deep), monthly sampling of groundwater wells, anchialine pools, outfalls, coastal and offshore sites (surface and bottom) for temperature, pH, salinity, DO, fecal coliform, enterococci, nutrients, total organic carbon, chlorophyll a, and turbidity. After 1992, anchialine pools, outfalls, coastal and offshore sites were reduced to quarterly collection and the offshore sites were changed to transects with 5 surface and 5 bottom collection locations and added benthic and fish surveys.	
Proj Purpose Fulfill NPDES and county permit requirements of monitoring groundwater, nearshore marine areas, anchialine pools, and aquaculture outfalls.	
Proj Usefulness Baseline data available before development. Long-term data set useful for trend analysis.

TOPIC Water Quality							
PARK : AMME	Project Title Garapan fuel pipeline remediation						
First Year: 1998 End Year: 2004 Status	Proj Duration						
Data Type/Location Unknown at this time. Up to 18 groundwater wells were installed inside the American Memorial Wetland and since capped by the ACOE.							
Comments: I have a copy of the first reconassaince plan (partial) that I copied from Steve Anthony at USGS. Kimber is making contact w/Steve's assistant Jeff, to divide up duties to get this information. Both Kimber and myself have both tried endlessly to find out about the old wells and new wells. We have gone back and forth b/t DEQ and ACOE. Currently we need to know: 1) was this monitoring plan enabled? 2) if so, where are the data and the progress reports and the final report? 2) where are the data for this reconassaince report?							
Data Collected Unknown at this time. Presumably the groundwaters were tested for hydrocarbons, heavy metals, and other industrial pollutants.							
Proj Purpose The wells were used to determine the extent of petroleum contamination at the site and implement a bio-technology process that will reduce soil and groundwater contamination to acceptable levels as specified by CEPOH contract monitor.							
Proj Usefulness

TOPIC	Water Quality
-------	---------------

PARK :	KAHO	Project Title	Shores at Kohanaiki Environmental Monitoring
--------	------	---------------	--

First Year:	2005	End Year:	Status	In work	Proj Duration
-------------	------	-----------	--------	---------	---------------

Data Type/Location	Water sampling will occur every two months at five nearshore transects fronting the property and three control sites as well as anchiline pools in line with transects. Marine community assessments are made in five areas (including one control area) with three transect each located in different ecological zones.
--------------------	--

Comments:	Also applies to ALKA. Duration unknown. This monitoring will be intensive at first until a baseline is established and then will drop off in frequency unless a problem is detected.
-----------	--

Data Collected	April 2005; 66 marine water samples from eight nearshore transects including one inside KAHŌ. May 2005; established and surveyed 15 transects to monitor marine communities.
----------------	--

Proj Purpose	Baseline water quality and biota monitoring for compliance with Special Management Area Use permit No. 439 to develop coastal parcel adjacent to the northern boundary of KAHŌ.
--------------	---

Proj Usefulness	
-----------------	--

TOPIC	Water Quality		
PARK :	KALA	Project Title	USGS stream monitoring
First Year:	1974	End Year:	1982
Status	Complete	Proj Duration	varies by gage
Data Type/Location	KALA; two stations on Waikolu Stream (gages #16408000 and #16405500), Molokai Tunnel east portal (gage #16405100), Waihanau Stream (gage #16409000) and Keolewa Stream (gage #16410000). USAR; Halawa Stream (gage #16226200). HALE; Palikea Stream (gage #16501200), PUHO; Kiilae stream (gage #16759800) far up-slope of PUHO boundary.		
Comments:	This stream monitoring station was located far up-slope of the park boundary.		
Data Collected	Currently: Halawa stream at USAR (gage #16226200) and Palikea Stream at HALE (gage #16501200) for discharge and peak height. Formerly: KALA; two stations on Waikolu Stream (gages #16408000 and #16405500) were monitored from 1969 to 1976 and one in the Molokai Tunnel east portal (gage #16405100) was monitored from 1975 to 1989. Two other stream gages in KALA were operated between 1940 and 1944 on Waihanau Stream (gage #16409000) and Keolewa Stream (gage #16410000); parameters included temperature, pH, and discharge. USAR; Halawa stream (gage # 16226200) from 1983 to 1999, water temperature, specific conductance, pH, dissolved oxygen, and unsuspended sediment. HALE; Palikea/Oheo Gulch (gage # 16501200) from 1972 to 1983, temperature, flow, specific conductance, and pH were monitored approximately every two months. Between 1972 and 1977, additional data on turbidity, color, carbon dioxide, alkalinity, carbonate, nutrients, hardness, dissolved solids, and various minerals were recorded. In 1972, assays for heavy metals and total coliform were performed. PUHO; Kiilae stream (gage #16759800) 1974-1982; flow, temperature, specific conductance, and pH.

TOPIC Water Quality	
PARK : NPSA	Project Title ASEPA Stream Water Quality Monitoring Program - Study#: NPSA-00211
First Year: 2003 End Year:	Status In work Proj Duration monthly counts since May 2003
Data Type/Location Samples taken from Fagatuitui Stream (the eastern most stream draining into Fagatuitui Cove) and Amalau Stream (east of Vatia) for one year June 2003 - May 2004. Starting in June 2004 samples are being taken from Agasavili Stream until May 2005.	
Comments: Permit#: NPSA-2003-SCI-0004.	
Data Collected Monthly specimen collections for field measurement and analysis. Some animals may be preserved for later analysis or identification. Organisms collected include: mountain bass (Kuhlia sp.), shrimp (Macrobranchium sp. Atya sp.), shrimp (Neritina sp.), and crane flies (Genus Diperta).	
Proj Purpose To determine whether stream water quality on Tutuila meets American Samoa water quality standards(ASWQS) for pH, dissolved oxygen (DO), turbidity, total suspended solids (TSS), total nitrogen (TN), total phosphorus (TP), and bacteria indicators. To assess the condition and integrity of stream waters in American Samoa using water quality, habitat, and biological data.	
Proj Usefulness Identifies the pollutants causing water quality impairments and the sources of those pollutants.

TOPIC Water Quality	
PARK : NPSA	Project Title Beach Water Monitoring Program
First Year: 2001 End Year:	Status In work Proj Duration
Data Type/Location Samples are analyzed for Enterococci and measurements of turbidity, conductivity, chlorophyll a, pH, temperature, salinity and dissolved oxygen are collected. One beach (Vatia)is near the park boundaries, and the remaining beach are in the territory.	
Comments:	
Data Collected Highly popular beach waters are sampled on a weekly basis. Less popular beach waters are sampled on a monthly or quarterly basis.	
Proj Purpose Recreational beach water monitoring to determine if beach is safe for swimming.	
Proj Usefulness Useful data for informing the public and other agencies of coast waters conditions as polluted waters affect the human and marine environments.

TOPIC	Water Quality		
PARK :	USAR	Project Title	Dynamics of the physical and chemical environment at the USS Arizona Memorial: 2002-200x
First Year:	2002	End Year:	2003
Status	In work	Proj Duration	one full year
Data Type/Location	Physical environment device (Sontek Triton wave/tide gauge with 10MHz ADV used to collect 3D single-point measurements of current velocity and acoustic backscatter data) deployed in 10m of wter 50 m southeast of USAR forward #1 turret. Seafloor here is organic rich fine silt/mud. Chemical monitoring device (YSI 6600 Sonde multisensor) deployed on USAR's hull collecting single-point measurements.		
Comments:	Kimber & Raychelle debated including this or not. We decided to leave it in; however, it is one of the few data sets for USAR. As a monitoring project it is important to USAR and the development of a model (of corrosion) to project in the future and could help determine what monitoring is needed.		
Data Collected	Current velocity, acoustic backscatter, pressure sensor to measure tides, direction wave spectra, water temp, salinity,pH,DO, and oxygen reduction potential measured every 15 minutes to 1 hour. Every 2 months devices were collected to download data.		
Proj Purpose	Objective was to understand how waves, currents & water column properties (temperature, salinity, pH, turbidity and dissolved oxygen) in the vicinity of the Memorial may vary over the year. This research is conducted to understand and characterize the nature and rate of natural processes affecting the deterioration of the USS Arizona		
Proj Usefulness	The rate of erosion of the boat is driven by different water quality factors. They will find out how these water quality parameters change during the course of a year, and how they change along the submerged ship.

PARK :	USAR	Project Title	Fort Kamehameha Wastewater Treatment Facility discharge monitoring
First Year:		End Year:	
Status	In work	Proj Duration	Continuous
Data Type/Location	treated water effluent and the mixing zone at the mouth of Pearl Harbor		
Comments:	This monitoring is conducted adjacent to USAR at the mouth of Pearl Harbor.		
Data Collected	The treated waste water is monitored continuously for total residual chlorine, and daily determinations are made for 5-day biological oxygen demand, total suspended solids, pH, oil and grease, and settling solids. Monthly analyses are performed to monitor effluent levels of ammonia, nitrate/nitrite, total nitrogen, total phosphorous, 5-day BOD, total suspended solids percent removal, heavy metals (cadmium, chromium, copper, lead, mercury, nickel, selenium, silver, and zinc), and toxicity testing with Ceriodaphnia dubia and Tripneustes gratilla. The estuarine mixing zone for discharged effluent is monitored quarterly for temperature, ammonia, nitrate/nitrite, total nitrogen, total phosphorous, turbidity, chlorophyll a, salinity, dissolved oxygen, and pH.		
Proj Purpose	monitor effluent from wastewater treatment facility

TOPIC Water Quality	
PARK : USAR	Project Title USEPA Environmental Monitoring and Assessment Program (EMAP)
First Year: 2002	End Year: Status In work Proj Duration continuous
Data Type/Location The USEPA implemented the Hawaii EMAP in 2002 which included 1 randomly selected site in Pearl Harbor's Middle Loch. Sample locations in the 2002 assessment were limited to embayments. Sampling will begin again in early 2005 at a new set of randomly Randomly selected locations will include open coastal areas as well as embayments. Hawaii sites selected in 2005 may be adjacent to KALA, HALE, ALKA, PUHE, PUHO, and HAVO. In 2004, American Samoa EPA collected from marine areas adjacent to and within NPSA. Guam EPA is beginning EMAP sampling in 2005 which will likely include sites within the marine areas of WAPA.	
Comments: THIS PROJECT ALSO PERTAINS TO WAPA, NPSA, KALA, HALE, ALKA, PUHE, PUHO, AND HAVO ALTHOUGH THE SITE LOCATIONS ARE NOT WITHIN PARK BOUNDARIES, THE CONDITION ASSESSMENTS WILL APPLY TO THE NEARBY MARINE RESOURCES.	
Data Collected The USEPA implemented the Hawaii EMAP in 2002, American Samoa in 2004, and Guam in 2005. Parameters include physical and chemical water quality; pH, temperature, salinity, dissolved oxygen, chlorophyll a, inorganic nutrients, total nitrogen, and total phosphorous. Fish and sediment sample are also collected and analyzed for bioaccumulation of heavy metals and industrial toxins.	
Proj Purpose Overall assessment of the condition of coastal and neashore waters of the US	
Proj Usefulness This information will be useful in assessing the condition of nearshore resources and focusing management restoration efforts to areas of concern.

TOPIC		Water Quality							
PARK :		WAPA							
Project Title		Recreational Waters Report Sampling Sites							
First Year:	1974	End Year:							
Status	In work	Proj Duration	on-going						
Data Type/Location	The monitoring program of Environmental Monitoring and Analytical Services Division takes water samples of 38 beaches every Wednesday; Beaches in close proximity to Piti and Asan include: Adelup Park Beach West, Asan Bay, Piti Park, Santos Memorial Park, United Seaman's Service, Rizal Beach, Namo Beach (North Togcha Beach), Agat Bay (Middle Togcha Beach), Southern Christian Academy Beach (South Togcha Beach). Lat/long, 3-yr trend chart, GEPA site number, sampling location description, number of recent advisories, and GWS classification for each site can be found at: http://www.guamepa.govguam.net/programs/emas/sites.html								
Comments:	Victoria Cummings was the contact for more information on the beach monitoring from the laboratory. Kimber Deverse talked with Jesse Cruz, but Anna Maria Leon Guerrero answered email questions. All three are biologists with the GEPA monitoring program.								
Data Collected	Grab sample collected and analyzed for concentrations of the enterococcus bacteria								
Proj Purpose	Part of Water Monitoring Strategy for the Territory of Guam (WMSTG) Monitoring of Guam's recreational beaches are mandated by 10 Guam Code Anootated, Chapter 47 (Water Pollution Control Act) to protect public health from the adverse effects of swimming in polluted waters. Guam EPA has provided this service to the community since 1974.

TOPIC	Water Quality		
PARK :	WAPA	Project Title	Surface Water Monitoring Network (SWMN)
First Year:	End Year:	Status	Complete Proj Duration
Data Type/Location	3 major water categories (river, marine, reef complexes) sampled on Rotating Basin Design (outlined by EPA's Env Monitoring and Assessment Program). Total of 65 River Stations, 17 Reef Stations and 38 Marine Stations. 4 subcomplexes sampled for two 6-week periods every other year (w/ first period during dry season (Jan-Jun); second during wet season (Jul to Dec). Over 2-yr period, all subcomplexes monitored. Monitoring prog includes biological portion (see biological monitoring section). River sites: three in the Piti/Asan Watershed, three in the Namo River, Togcha River, Salines River, Finile Creek. Reef sites: Agat Bay (mouth of Namo and north of Agat STP outfall) Marine Site: Agat Bay (Agat STP outfall)		
Comments:	<p>Anna sent Kimber DeVerse, forward to Raychelle Daniel, a copy of an excel spreadsheet with locations with lat/long & exact location description (there were locations located within the park).</p> <p>While chemical water sampling provides a snapshot of conditions at the time of sample collection, biological, sediment and tissue results provide a view of conditions over a somewhat longer time period. Based upon this, the Revised Guam NPS monitoring program will serve to assess the effectiveness of agricultural and urban management measures that are currently being implemented island wide. Guam's NPS monitoring program and the Guam Water Monitoring Strategy (GWMS) are currently being revised to incorporate new elements to its Biological Monitoring Program. NOT CURRENT MONITORING.</p> <p>The original "Marine Biological Monitoring" was designed to only collect data on species composition, substrate type, percent cover, and fish assemblage. This program is being expanded to now include a "Toxic Materials Monitoring Program for Sediment and Tissue," and a "Freshwater Periphyton and Benthic Macroinvertebrates Assessment Program."</p> <p>The Freshwater Periphyton and Benthic Macroinvertebrates Assessment Program for Guam's river are being developed and drafted from techniques modified from USEPA guidance's (EPA 841-D-97-022) and the 18th Edition Standard Methods. The goals of this program are to qualitatively and quantitatively assess the periphyton and benthic macroinvertebrate assemblages in Guam's freshwater environments with water quality during the wet and dry seasons. Draft Documents will not be finalized until all metrics are tested and verified and all supporting documents (i.e., Sampling Analyses Plan [SAP], Stand Operating Procedures [SOP], Data Quality Objectives [DQO], and a Quality Assurance Program Plan [QAPP]) are also developed and finalized. The projected time frame for document completion and metric verification is the end of fiscal year 2002.</p>		
Data Collected	"conventionals": pH, Total Suspended Solids, Total Dissolved Solids, Temperature, Turbidity, Nitrite-nitrogen, Dissolved oxygen, Salinity, Nitrate-nitrogen, Total phosphorous, Ortho-phosphorous.		
Proj Purpose	With the beach monitoring, the two comprise The Water Monitoring Strategy for the Territory of Guam (WMSTG). Which the goals are to: Conduct a comprehensive assessment of water quality throughout the island using a rotating basin approach; Complete a thorough evaluation of monitoring data. SWMN focuses mainly on the southern region of Guam, where the majority of all surface water features exist. The coastal assessment of Guam is also covered under the SWMS as the Marine and Reef Flat Networks. These two networks are incorporated into one overall network from headwaters to receiving waters, by watershed, to profile the dispersion of pollutants. Evaluate if the quality of the Island's waters is suitable for their designated uses; Evaluate if the Guam WQS are appropriate and relevant to present conditions in the waters of the Island; and Coordinate new approaches to improving and protecting the islands water resources
